

# **2008 Integrated Resource Plan**

**Oregon Addendum**

**June 2009**

Cascade provides this addendum to its 2008 Integrated Resource Plan which was filed with both the Oregon Public Utility Commission and the Washington Utilities and Transportation Commission on December 15, 2008. The addendum provides further details regarding how the Company intends to address the capacity shortfalls identified in the plan and includes additional documentation of the Company's portfolio analyses.

### **Identified Capacity Shortfalls and Solutions**

The 2008 Plan indicates that additional capacity resources will be required to meet core peak loads. The Company's 2008 Plan includes references to relying on short-term citygate resources during the near term and during the longer term the Company plans to participate in a Rockies Expansion project, likely the Sunstone/Blue Bridge expansions, providing they move forward. The following provides further explanation regarding both the near term and longer term capacity solutions.

In the near term, years one through four (through 2012), Cascade has supply contracts that provide delivery to citygates on Cascade's system. The capacity graphs and tables originally included in Appendix F (pages 239 through 258) have been updated to reflect both the Pipeline Delivery capability at the various zones as well as the citygate supplies that are currently under contract that are available to meet peak requirements. The revised tables, which are included at the end of this document, are identified as Appendix F pages 239-1 through 239-16. The revised graphs demonstrate that through 2012 Cascade has adequate resources to meet core requirements through the combination of pipeline capacity and citygate delivered supply.

The company did not consider citygate resources to provide relief on the Wenatchee Lateral (located in Eastern Washington) as that lateral is fully subscribed; however, the Plan assumes the recall of the outstanding long-term releases (Washington Rate Schedule 685) that will be recalled at the end of their primary terms which occur in 2010 and 2011. Between 2009 and 2011 period, the existing capacity on the Wenatchee Lateral is adequate to meet core requirements for a 64 degree day peak. Based on the frequency analysis, 99% of the time winter weather on the Wenatchee lateral will be warmer than 65DD; 97% of the time, weather will be warmer than 56 degree days. Although it is unlikely to be necessary, the Company does have the right to recall the previously released capacity under certain conditions, including an extreme weather event where residential and small commercial load requirements would make it necessary to do so.

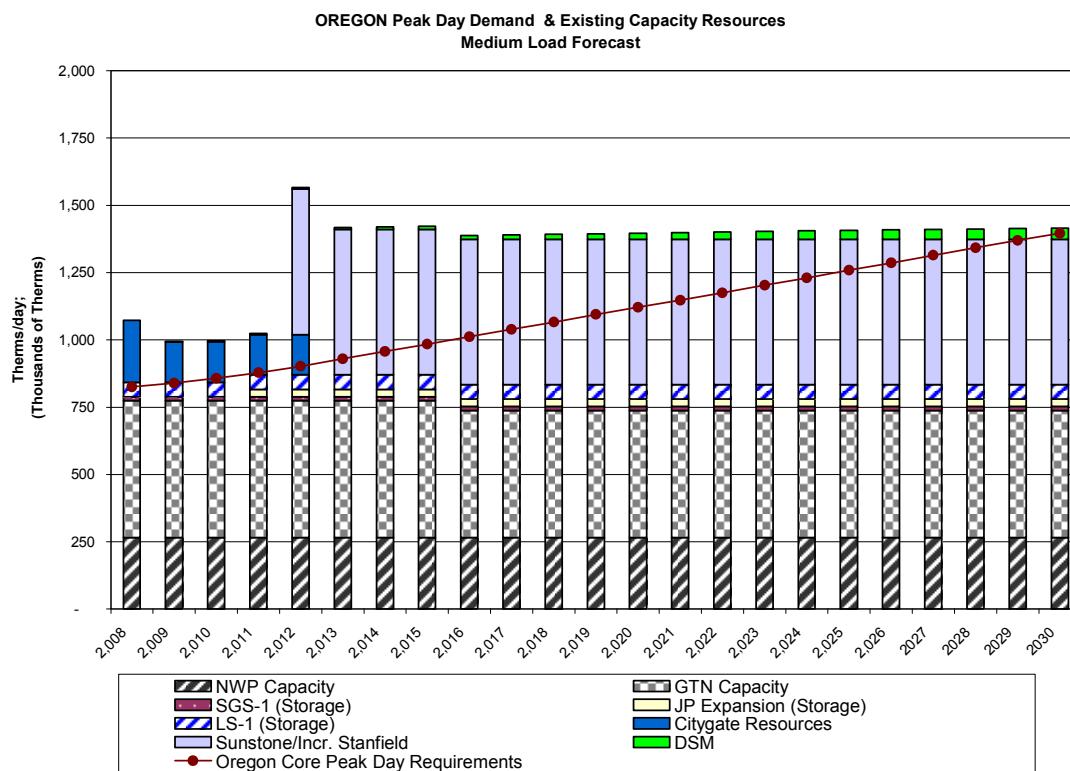

In the longer term, the solutions identified in the IRP to meet load requirements on the Wenatchee lateral, (Zones 10 and 11), located in Cascade's Washington Service territory included some local Bio-Gas and possible Satellite LNG solutions in the outer years (2013 and beyond). Currently it is estimated, that over the planning horizon, Bio-gas would provide approximately 200 dekatherms/day and

---

Satellite LNG solutions would provide an additional 5,000 dekatherms/day of peak day resources to the Zone 10 and Zone 11 region. Cascade is currently working with PSE to investigate solutions to meet the growing load on the Wenatchee lateral, including the possibility of a pipeline looping solution. Any pipeline solution will be dependent upon the participation of PSE and other parties and Cascade would be a small participant in those solutions. At this time, it is estimated that Cascade's core load requirements would represent less than 10% of a joint pipeline solution.

To meet the load requirements for 2012 and beyond, the model chose the combination of Sunstone and Blue Bridge pipeline expansion projects. Sunstone in combination with incremental vintage GTN capacity from Stanfield to points in Central Oregon will be used to meet the capacity requirements identified in Zone GTN. No other capacity shortfalls are anticipated over the planning horizon at the Oregon zones (Zones 24, ME-Or, Zone GTN). Figure 7-C-1 below, shows how Cascade will meet Oregon's load requirements over the planning horizon under the preferred portfolio. Specific timing and amount of resource selections contained in the preferred portfolio (Basecase #2889) are shown in Table 7-4-A on the following page.

**FIGURE 7-C-1**

**Table 7-4-A**

OPUC Staff has indicated they have concerns regarding the Company's preferred portfolio which assumes that the Sunstone/Blue Bridge project will move forward. In preparing the 2008 Plan, the company did analyze scenarios without the Sunstone/Blue Bridge project and the modeling results indicate that additional GTN and NWP capacity were preferred over the other pipeline expansion alternatives included in the analysis (See Appendix F-2 pages 258-1 through 258-14). Table 7-5 found on page 12 of this addendum provides a complete listing of the incremental resources selected under the various portfolio scenarios.

Although there are other Rockies expansion projects, all are targeted to move supplies from the Rockies region to Malin, and GTN has indicated that firm backhaul services will not be available to move supplies on the GTN system. Without backhaul capability on GTN, there is no way to reach Cascade's Oregon citygates on a firm basis. Therefore, when modeling alternate Rockies expansion projects, the company estimated that costs for firm backhaul rights would be 3 times the current GTN rates and the model did not select these projects. The company also ran a sensitivity analysis to determine whether the estimated firm backhaul costs were driving the models results to choose the Sunstone/Blue Bridge project over the other rockies pipeline expansion projects. For sensitivity analysis purposes, the company did prepare an additional scenario that assumed backhaul would be available on GTN at the existing tariffed rates. The availability of this service would be subject to displacement using forward haul volumes to Malin. Even under this more favorable scenario, the model continued to select Sunstone over the other rockies project, likely because of Sunstone's ability to move supplies to areas beyond the Central Oregon area.

Since the IRP is considered a point in time document, should the Sunstone/Blue Bridge projects not move forward, the Company will update our analyzes based on the most current information available before relying solely on the alternate choices identified in this IRP.

### **Supply Side Alternatives Supplement**

Section 6 of the filed plan discusses the supply side alternatives analyzed during the 2008 planning cycle. The text references Appendix E that provided a summary of the supply side alternatives considered during the planning process, including the resource's costs, lead time (if any), in-service date, duration and its location. In this addendum, Cascade has prepared a revised Appendix E that supplements the information contained on pages 230 and 231 of the text and prepares the supply side alternative list for each of the scenarios/portfolios identified in the plan. The new appendix lists the alternatives and highlights differences to the basecase scenario assumptions so that the amounts, costs and timing of the resource alternatives for each portfolio are more clearly identified. Additionally, the Company has included an additional write-up (identified as pages 231-31 and 231-32) regarding the development of the price forecast assumptions utilized in the IRP. The summary supplements the price forecast discussion included on pages

---

68 and 69 of the original Plan and the detailed price forecast information included in Appendix E on pages 232 through 238.

### **Preferred Portfolio Results & Analysis**

During the review process, Staff indicated concerns regarding the adequacy and transparency of the portfolio analyses included in the 2008 Integrated Resource Plan. In the filed plan, the company provided an overview of the various portfolios considered during the planning process and the results of the analyses. The Plan's focus was on the resources selected during the modeling process and how changes to underlying assumptions (such as limited supply availability in Canada or loss of the Rockies price advantage) impacted the resource selections and overall portfolio costs. Table 7-1-A, which begins on the following page, is a companion document to the original information described in Tables 7-1 and 7-2 of the original text. Table 7-1-A provides a more detailed explanation of the various portfolios analyzed and a brief discussion of the specific results of the analysis, as well as cross references the pages in Appendix E where detailed documentation for each supply side alternative included in the portfolio is contained. Additional documentation regarding the modeling results of the portfolio analyses, including annual costs and resource selections are contained in Appendix F-2. Table 7-5 found on page 12 of this addendum provides a complete listing of the incremental resources selected under the various portfolio scenarios.

As discussed throughout the plan, the preferred portfolio identified in Cascade's 2008 IRP is the Basecase Scenario (#2889). Table 7-4 in the original text provided a summary of the 20-year portfolio costs and Table 7-4-A shown on page 3 of this document details the resource selections and costs by year for this preferred portfolio. The tables contained in Appendix F-2 are companion documents to Table 7-4 and display information regarding the various portfolios ability to meet core requirements, both on an annual and peak day basis and clearly identify the timing and amount of the incremental resources selected to meet the anticipated core load. Additionally, the tables provide the supply, storage, and transportation costs for each year of the 20 year planning horizon along with the overall NPVRR associated with the portfolio.

Table 7-4 and Figure 7-J in the original text provided the total modeling results and rank ordered the portfolios in terms of 20 year NPVRR. As indicated in the original text and further demonstrated in Table 7-1-A, the Company prepared several portfolio and sensitivity analyses to reach the conclusions that the Basecase scenario (#2889) is the Company's preferred portfolio. The company believes that it has demonstrated throughout the filed plan and with the additional information included in this addendum that the portfolio results from the Basecase scenario meet the Company's stated reliability, cost and risk objectives as required in OPUC Guideline #11 and #4h. The Basecase portfolio's proposed resource solutions represent the least cost alternatives for meeting the core peak day requirements and also provide additional diversity to the core portfolio.

---

**TABLE 7-1-A**  
**SUMMARY OF PORTFOLIO ANALYSES AND RESOURCE ALTERNATIVES**  
**SUPPLEMENT TO TABLES 7-1 and & 7-2**

SENDOUT RUN	Key elements in SENDOUT modeling	Discussion
All Resources (#2901)  See details on Appendix E – All Resources Run Pages 231-1 and 231-2	<p>Existing supply contracts, incremental supplies (peaking, annual, seasonal and citygate) from various receipt points (AECO, Rockies, Sumas, Station 2, as well as behind the citygate (satellite LNG). Incremental supplies also include Biomass, satellite LNG (behind citygate), imported LNG (Kitimat, Jordan Cove, Bradwood Landing), current upstream pipeline transport capacity, as well as proposed pipelines and extensions (Blue Bridge, Ruby, Pacific Connector, Palomar, and Sunstone). We also included Cascade's current Jackson Prairie storage accounts, our Plymouth LNG account, as well as the potential to obtain AECO and Mist storage.</p> <p>The key data inputs are spelled out in detail in individual Append E resource alternatives tables. There is a separate section for each SENDOUT run listed in this table which provides key data elements used in the model.</p> <p>This information includes the type of resource, effective dates, receipt points, potential delivery points/pipelines, price index used along with the demand component and basis premium that affected the cost of the resource. Additionally, the tables show the volume (in dths) for contracts with the specific amounts for existing contracts and the maximum volume the model was allowed to size for incremental resources.</p>	<p>In this run, Sunstone was selected to meet Cascade's pipeline capacity shortfall, starting in 2011. Sunstone allows Cascade to move Rockies supplies to the Pacific Northwest, and combined with incremental transportation on GTN, will address capacity shortfalls. Additionally, Sunstone will provide supply diversity to Cascade's customers in Oregon, who have been traditionally served for the most part with natural gas supply from Alberta. Additionally, Sunstone combined with Blue Bridge pipeline provides the means to bring Rockies supplies to the I-5 corridor.</p> <p>A small volume of bio-gas appears to be a potential resource to address shortfalls in zones 10 and/or 11 (the Wenatchee lateral). Assuming any gas quality issues are satisfactorily addressed, bio-gas could also eliminate or reduce distribution system constraints.</p> <p>Satellite LNG facilities located within Cascade's distribution system may also be an attractive alternative to incremental pipeline capacity in areas where physical limitations at the gate stations would result in even higher costs associated with a pipeline solution. There may be additional advantages to such a strategy to the extent a facility could be strategically located on a portion of the distribution system that will eliminate or reduce distribution system constraints.</p>

**TABLE 7-1-A**  
**SUMMARY OF PORTFOLIO ANALYSES AND RESOURCE ALTERNATIVES**  
**SUPPLEMENT TO TABLES 7-1 and & 7-2**

SENDOUT RUN	Key elements in SENDOUT modeling	Discussion
Basecase (#2889)  See details on Appendix E – Base Pages 231-3 and 231-4  <b>PREFERRED PORTFOLIO</b>	Existing supply contracts, incremental supplies (peaking, annual, seasonal and citygate) from various receipt points (AECO, Rockies, Sumas, Station 2, as well as behind the citygate. Incremental supplies also include Biomass, satellite LNG (behind citygate), imported LNG (Kitimat), current upstream pipeline transport capacity, as well as proposed pipelines and extensions (Blue Bridge, Sunstone). We also included Cascade's current Jackson Prairie storage accounts and our Plymouth LNG account.	The All Resources Run did not select Bradford Landing, Jordan Cove as resources as these each required expensive capacity or backhaul capability. This therefore prevented Palomar and Pacific Connector from being selected for their transportation. The model preferred the Sunstone/Blue Bridge combination over an Ruby Pipeline. The affect of rate stacking for AECO storage plus the storage rates and probable need for incremental upstream capacity prevented the model from selecting the AECO and Mist storage resources. As a result, we removed these items from the basecase to run subsequent scenarios and sensitivities.
Basecase Limited Canadian Imports (#2890)  See details on Appendix E – Limited Canadian Pages 231-5 and 231-6	Model contains all the elements of the Basecase, but incremental Annual AECO and seasonal Sumas resources are unavailable to the model (specifically Incrm-Firm3 and Incr Wtr5). Additionally, annual Sumas max is lowered from 100,000 to 50,000 dths. The intent to is to restrict the amount of Canadian imports by at least 20% (the amount is actually greater).	In this run, the model chose to increase the amount of imported LNG at Kitimat as Canadian resources were restricted. It should be noted that we ran numerous sensitivities with varying levels of restrictions in order to see the impact to the portfolio. The results were consistent with the findings above.
Basecase Sunstone No Blue Bridge (#2892)  See details on Appendix E – SUN NO BB Pages 231-7 and 231-8	Model contains all the elements of the Basecase, but Blue Bridge is not available as a potential resource to the model; however, Sunstone remains an option to move Rockies gas to Stanfield for delivery to Oregon. This also meant removing the tie that Blue Bridge had to deliver Rockies supply to the I-5 corridor.	The model continued to select Sunstone.
Basecase Blue Bridge No Sunstone (#2891)  See details on Appendix E – BB NO SUN Pages 231-9 and 231-10	Model contains all the elements of the Basecase, however, Sunstone was not available as a potential resource; Rockies gas had no choice but to flow on NWP.	Blue Bridge was never selected under this run. Without Sunstone (and its associated Rockies supply), Blue Bridge in this run has no supply source that is cost effective. Even when considering moving AECO gas at Stanfield to another NWP or Blue Bridge, NWP continues to be the most cost effective means.

**TABLE 7-1-A**  
**SUMMARY OF PORTFOLIO ANALYSES AND RESOURCE ALTERNATIVES**  
**SUPPLEMENT TO TABLES 7-1 and & 7-2**

<b>SENDOUT RUN</b>	<b>Key elements in SENDOUT modeling</b>	<b>Discussion</b>
Basecase No Rockies price advantage (#2893)  See details on Appendix E – No Rockies Advantage Pages 231-11 and 231-12	Model contains all the elements of the Basecase; however, all potential incremental resources were priced at NYMEX with no basis adder. In other words, incremental AECO, Sumas and Rockies all have the same price. Incremental resources at Station 2 were not available to the model. Transportation rates were not modified from their basecase levels.	In this run, more Rockies gas was moved as was imported LNG (since it was priced less than NYMEX)
Basecase Ruby Pipeline (#2894)  See details on Appendix E – Ruby Pages 231-13 and 231-14	Model contains all the elements of the Basecase; however, Ruby Pipeline is added as an additional resource. For modeling purposes we started with Ruby transport priced at 3 times the current NWP rate. The model is set up so that Ruby becomes an option to move Rockies gas to GTN, where it would require incremental GTN capacity (backhaul) to move to Cascade's citygates.	This run considered moving Rockies supplies to Malin via Ruby Pipeline and then backhauling supplies on GTN to serve Central OR. The model, when given the option of utilizing Sunstone and capacity on GTN, chose Sunstone over Ruby. The assumed costs of the backhaul from Malin to the citygates off of GTN make Sunstone the more cost effective option. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time.
Basecase Pacific Connector (#2896)  See details on Appendix E – PAC CONN Pages 231-15 and 231-16	Model contains all the elements of the Basecase; however, Pacific Connector is added as an additional resource. In addition, we added incremental LNG (Jordan Cove) as a potential resource. For modeling purposes we started with Pacific Connector transport priced at approximately 3 times the current NWP rate. The model is set up so that Pacific Connector becomes an option to move imported LNG to GTN, where it would require incremental GTN capacity (backhaul) to move to Cascade's citygates.	This run considered transporting LNG from Jordan Cove via Pacific Connector Pipeline and then backhauling supplies on GTN to serve Central OR. This scenario is complicated because it is unclear whether GTN will provide backhaul capability. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time. It appears the infrastructure required to provide that firm backhaul service on GTN coupled with the transport from the facility makes this scenario appear to be undesirable, given other potential options, such as Sunstone and Blue Bridge.

**TABLE 7-1-A**  
**SUMMARY OF PORTFOLIO ANALYSES AND RESOURCE ALTERNATIVES**  
**SUPPLEMENT TO TABLES 7-1 and & 7-2**

<b>SENDOUT RUN</b>	<b>Key elements in SENDOUT modeling</b>	<b>Discussion</b>
Basecase Palomar (#2895)  See details on Appendix E – Palomar Pages 231-17 and 231-18	Model contains all the elements of the Basecase; however, Palomar Pipeline is added as an additional resource. In addition, we added incremental LNG (Bradwood Landing) as a resource. For modeling purposes we started with Palomar Pipeline transport priced at approximately 3 times the current NWP rate. The model is set up so that Palomar becomes an option to move imported LNG to GTN, where it would take incremental GTN capacity (backhaul) to move to Cascade's citygates.	This scenario was developed to move LNG from Warrenton Oregon, connecting to Palomar Pipeline and ultimately delivered to Madras OR where it would flow on incremental GTN capacity to serve Central OR. When SENDOUT was given the option to flow Sunstone or this Palomar scenario, the model continued to select Sunstone. At this time, it is uncertain whether or not the facility at Warrenton will be put into service. Further complicating this issue is the likelihood that it is unclear whether GTN will provide backhaul capability. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time. It appears the infrastructure required to provide that firm backhaul service on GTN coupled with the transport from the facility makes this scenario appear to be undesirable, given other potential options.
Basecase AECO Storage (#2900)  See details on Appendix E – AECO Storage Pages 231-19 and 231-20	Model contains all the elements of the Basecase; however, AECO storage is added as a resource. The inventory is set at 300,000 dths, with daily withdrawal rights of 10,000 dths a day. This storage was setup like the existing Jackson Prairie to be 100% full at the start of each heating season. The model is set up so that Canadian withdrawals can use incremental GTN capacity.	The affect of the storage rates, plus the limitations on supply sources to refill (AECO), as well as the effect of rate stacking on three pipelines (NOVA, Foothills and GTN) in order to reach the distribution system prevented this resource from being selected.
Basecase Mist Storage (#2899)  See details on Appendix E – Mist Storage Pages 231-21 and 231-22	Model contains all the elements of the Basecase; however, Mist storage is added as a potential resource. The inventory is set at 300,000 dths, with daily withdrawal rights of 10,000 dths a day. This storage is set up like the existing Jackson Prairie to be 100% full at the start of each heating season. The model is set up so that Mist withdrawals can use incremental NWP capacity. We used in effect rates.	The affect of the storage rates plus the need for incremental capacity on NWP prevented this resource from being selected. It should also be noted that this scenario has a reliance on displacement with Washougal compressor station on NWP, further complicating the ability to move this gas to the Cascade system.

**TABLE 7-1-A**  
**SUMMARY OF PORTFOLIO ANALYSES AND RESOURCE ALTERNATIVES**  
**SUPPLEMENT TO TABLES 7-1 and & 7-2**

SENDOUT RUN	Key elements in SENDOUT modeling	Discussion
Basecase Palomar Discount (#2902)  See details on Appendix E – Palomar Discount Pages 231-23 and 231-24	Model contains all the elements of the Basecase; however, Palomar Pipeline is added as an additional resource. In addition, we added incremental LNG (Bradwood Landing) as a resource. For modeling purposes we started with Palomar Pipeline transport priced at approximately 3 times the current NWP rate, but ran sensitivities at increasing lower rates to find a price where the model would finally select Palomar (this happened around the ten cent range). The model is set up so that Palomar becomes an option to move imported LNG to GTN, where it would take incremental GTN capacity (backhaul) to move to Cascade's citygates.	This scenario was developed to move LNG from Warrenton Oregon, connecting to Palomar Pipeline and ultimately delivered to Madras OR where it would flow on incremental GTN capacity to serve Central OR. When SENDOUT was given the option to flow Sunstone or this Palomar scenario, the model continued to select Sunstone. At this time, it is uncertain whether or not the facility at Warrenton will be put into service. Further complicating this issue is the likelihood that it is unclear whether GTN will provide backhaul capability. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time. It appears the infrastructure required to provide that firm backhaul service on GTN coupled with the transport from the facility makes this scenario appear to be undesirable, given other potential options. The model did not select Palomar until the transport rate was around \$0.10 per dth. This run was designed to confirm that Sunstone/Blue Bridge was the more cost effective method to get incremental, non-Canadian supplies to Oregon.
Basecase Ruby with updated Ruby and GTN Backhaul rates (#2908)  See details on Appendix E – Ruby Backhaul Update Pages 231-29 and 231-30	Model contains all the elements of the Basecase; however, Ruby Pipeline is added as an additional resource. For modeling purposes we started with Ruby transport priced at \$30.998 (the current monthly rate converted to a daily rate at \$1.019 p/dth per Ruby's current tariff). After discussions with GTN, we decided not to utilize the Medford backhaul rate (approx \$0.65 p/dth) as a backhaul to CNG at this point in time would not have a lateral rate. However, we did, as GTN suggested, use a forward haul rate for the backhaul rate. GTN made it clear that backhaul service is NOT FIRM, as it is subject to displacement.	This run considered moving Rockies supplies to Malin via Ruby Pipeline and then backhauling supplies on GTN to serve Central OR. The model, when given the option of utilizing Sunstone and capacity on GTN, chose Sunstone over Ruby and "backhaul" capacity on GTN. This run was designed to confirm that Sunstone/Blue Bridge was the more cost effective method to get Rockies supplies to Oregon. Additionally, Sunstone is the more flexible option as it can move supplies to both WA and OR versus Ruby which would be limited to service Central Oregon. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time.

**TABLE 7-1-A**  
**SUMMARY OF PORTFOLIO ANALYSES AND RESOURCE ALTERNATIVES**  
**SUPPLEMENT TO TABLES 7-1 and & 7-2**

SENDOUT RUN	Key elements in SENDOUT modeling	Discussion
Basecase Ruby Pipeline Discount (#2897)  See details on Appendix E – Ruby Discount Pages 231-25 and 231-26	Model contains all the elements of the Basecase; however, Ruby Pipeline is added as an additional resource. For modeling purposes we started with Ruby transport priced at approximately 3 times the current NWP rate, but ran sensitivities at increasing lower rates to find a price where the model would finally select Ruby (this happened around the ten cent range). The model is set up so that Ruby becomes an option to move Rockies gas to GTN, where it would take incremental GTN capacity (backhaul) to move to Cascade's citygates.	This run considered moving Rockies supplies to Malin via Ruby Pipeline and then backhauling supplies on GTN to serve Central OR. The model, when given the option of utilizing Sunstone and capacity on GTN, chose Sunstone over Ruby. The assumed costs of the backhaul from Malin to the citygates off of GTN make Sunstone the more cost effective option. The model did not select Ruby until the transport rate was around \$0.10 per dth. This run was designed to confirm that Sunstone/Blue Bridge was the more cost effective method to get Rockies supplies to Oregon. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time.
Basecase Pacific Connector Discount (#2903)  See details on Appendix E – PAC CONN Discount Pages 231-27 and 231-28	Model contains all the elements of the Basecase; however, Pacific Connector is added as an additional resource. In addition, we added incremental LNG (Jordan Cove) as a resource. For modeling purposes we started with Pacific Connector transport priced at approximately 3 times the current NWP rate, but ran sensitivities at increasing lower rates to find a price where the model would finally select Pacific Connector (this happened around the ten cent range). The model is set up so that Pacific Connector becomes an option to move imported LNG to GTN, where it would take incremental GTN capacity (backhaul) to move to Cascade's citygates.	This run considered transporting LNG from Jordan Cove via Pacific Connector Pipeline and then backhauling supplies on GTN to serve Central OR. This scenario is complicated because it is unclear whether GTN will provide backhaul capability. If Sunstone is not built it is reasonable to assume that GTN might consider backhaul capability at that time. It appears the infrastructure required to provide that firm backhaul service on GTN coupled with the transport from the facility makes this scenario appear to be undesirable, given other potential options, such as Sunstone and Blue Bridge. The model did not select Pacific Connector until the transport rate was around \$0.10 per dth. This run was designed to confirm that Sunstone/Blue Bridge was the more cost effective method to get incremental, non-Canadian supplies to Oregon.

<b>Range of Selection (000's DKTH/Day)</b>		11 to 78	0 to 69	0 to 10	10 to 30	0 **	0 **	0 **	0	0	0	0	0 to 12	3 to 141	0 **	0 **
<b>Basecase Selected Level</b>	<b>#2889</b>	<b>54</b>	<b>10</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>2</b>	<b>0</b>	<b>0</b>	<b>0</b>	<b>6</b>	<b>11</b>		

\*\* Excludes results of Negotiated Rate sensitivity analyses since it is not reasonable to assume that a negotiated rate of 10 cents can be achieved

**2008 Action Plan**

During the review period, Staff indicated that the company did not provide the specificity needed in its Action Plan as required in the OPUC guidelines. Particularly, Staff indicated that the conservation targets, although detailed in Section 5 of the text, must also be included in the 2-year action plan. Therefore, the Company provides the following revised 2-year Action Plan.

As indicated in Section 8 of the original plan, Cascade's 2008 Action Plan is focused on the following five areas:

- Demand Forecasting
- Distribution System Constraint Analysis
- Demand Side Resources
- Supply Side Resources
- Integration

The 2 year Action Plan embodies Cascade's commitment to maximizing the efficiency from its Integrated Resource Plan and to achieving the lowest cost resource portfolio of reliable natural gas services and conservation. Figure 8-A shown on the following page details the timeline associated with the 2 year Action plan commitments

1. In continuing efforts to create a more accurate load forecast, Cascade will research the viability of expanding the detail of the data by determining therm usage per customer per degree day by customer class (residential, commercial, etc.) along with the non-heat sensitive baseload usage. This is largely dependent upon the capabilities of the Company's new Customer Information System which is currently anticipated to "Go-Live" during mid-2009.
2. Cascade will continue to monitor outside determinants of natural gas usage, such as legislative building code changes and electrical "Direct Use" campaigns as they are determined to significantly affect the Company's forecast.
  - a. Cascade will analyze the potential impact of Puget Sound Energy's Direct Use campaign on customer usage in Washington by June 2010.
3. The company continues to explore the incorporation of price elasticity in future forecasts of demand. The integration of this variable in future models will be dependent upon the practicality of its application and significance of its effect.

<b>1 - DEMAND FORECAST</b>																									
1.1 - Expand Use/Degree Day by Customer Class Modeling																									
1.2 - Analyze Impact of Direct Use Campaigns																									
1.3 - Reexamining Price Elasticity Impacts on Core Loads																									
<b>2 - DISTRIBUTION SYSTEM CONSTRAINT ANALYSIS</b>																									
2.1 - Estimate Avoidable Costs of Eliminating Constraint Areas																									
<b>3 - DEMAND SIDE RESOURCE ASSESSMENT &amp; ACQUISITION</b>																									
3.1 - Monitor Adequacy of Public Purpose Funding																									
3.2 - Conservation/Therm Saving Acquisition																									
3.3 - Monitor Western Climate Initiative & Potential Carbon Legislation																									
3.4 - Evaluation of New Measures																									
<b>4 - SUPPLY SIDE RESOURCE ANALYSIS</b>																									
4.1 - Rockies Pipeline Expansion participation (Sunstone/BlueBridge)																									
4.1a - Alternative Solutions if Sunstone/Blue Bridge cancelled																									
4.1b - Wenatchee Lateral Analysis																									
4.2 - Wenatchee Alternatives (as available)																									
<b>LEGEND</b>																									
Major action plan items																									
Components of major items																									

4. Cascade will continue to monitor the effectiveness of the Oregon Public Purpose Fund to ensure the funds are adequate to capture significant portions of achievable therm savings in Oregon. If it is determined that an increase in this Fund will create a subsequent increase in therm savings, the company will move to act appropriately.
  - a. Oregon's incremental annual therm savings targets for the 2009 and 2010 period are 282,657 and 329,937 therms respectively. Estimated spending to achieve the therm savings targets outlined above are \$1,494,000 and \$1,746,000 respectively.
5. The company will continue to follow and analyze the impacts of the Western Climate Initiative and proposed carbon legislation at both the state and federal level as they pertain to natural gas conservation, as well as other such acts that may arise from these efforts. The company will continue to monitor the timing and the costs associated with carbon legislation and analyze the impacts on the company's overall portfolio costs. As specific carbon legislation is passed, the company will update its avoided cost calculations, conservation potential and make modifications to its DSM incentive programs as necessary.
  - a. The company is evaluating the potential costs associated with the Waxman/Markey legislation and estimating the impacts on its resource portfolio.
6. The company will continue to monitor the cost effectiveness of existing conservation measures and emerging technologies to ensure that the current mix of measures included in the Washington Conservation program is appropriate. Areas for further analysis include the impacts associated with modifications to building codes along with the cost effectiveness of newer technologies such the next generation of high efficiency water heaters (.70 EF) and high-efficiency hybrid heat pumps. The applicability of these measures within Cascade's service territory will be analyzed and the company's Conservation Incentive Program will be modified as necessary.
7. The company will continue to work with its Conservation Advisory Group, its third party vendors and its Low income weatherization network to ensure that the therm savings targets identified in the plan are met.
  - a. As outlined above, the Company's targeted therm savings for Oregon for the 2009 and 2010 period are 282,657 and 329,937 therms respectively.
8. The Company will continue to update its distribution system analysis to reflect the impacts of conservation. The company will continue to target its conservation

acquisition efforts in those areas where potential distribution constraints have been identified in the hope that some of those investments maybe delayed.

- a. The company will work with the Energy Trust to ensure that conservation acquisition efforts are targeted to central Oregon and Hermiston area.
  - b. The Company will update its Oregon distribution analysis during Summer 2009 to re-assess the reinforcement requirements during the 2010 to 2013 period in light of the current recession and actual conservation achievements in 2008 and 2009 by the Energy Trust.
9. Cascade will continue to evaluate gas supply resources on an ongoing basis including supplies of varying lengths (base, swing, peaking) and pricing alternatives. We will continue to analyze the uncertainties associated with volatile supply and demand relationships and will closely monitor and participate in industry discussions regarding diminishing Canadian gas exports. Of particular concern to us are changing conditions on Northwest Pipeline. As our principle upstream pipeline, Northwest Pipeline, is a displacement pipeline dependent upon receiving large amounts of Canadian natural gas exports. The risk associated with reduced Canadian exports is a significant concern and therefore it is critical for Cascade to continuously look for opportunities to improve our supply/capacity diversification.
10. The Company will continue to monitor the proposed pipeline expansion projects to access more supplies out of the Rockies. As cost estimates change, the company will analyze those resources under consideration to determine if modifications to the preferred portfolio are necessary.
- a. The Company participated in the initial Open Season associated with the Sunstone/Blue Bridge pipeline in 2008
  - b. Update analysis completed and response from CNG Board due late Summer 2009
11. Continue to refine our specific peak day resource acquisition action plans to address anticipated capacity shortfalls on the Wenatchee and Shelton laterals. Possible solutions include Satellite LNG or pipeline looping to meet the growing requirements of the firm core load. Specifically, the Company will further analyze issues such as determination of project siting issues and risks, project cost estimates, and construction/acquisition lead times.
12. The company will continue to explore options to incorporate BioGas into its portfolio, as specific projects are identified in our service territory. Price, location and gas quality considerations of the Bio-Gas supply.will be evaluated.
-

13. The company will continue to monitor proposed LNG import facilities as information becomes available and will evaluate the various options that, if built, could be used to meet core requirements. Issues to monitor include specific cost, the availability of pipeline capacity and project timing.
14. The Company will continue to monitor the futures market for price trends and will evaluate the effectiveness of its risk management policy.

## SUPPLEMENTAL INFORMATION REGARDING THE DEVELOP OF THE NATURAL GAS PRICE FORECAST

### Natural Gas Price Forecast

Price volatility has become an on-going factor in the natural gas industry since 2005. Prices in the natural gas market have continued to be volatile. Prices started climbing in January 2008 and kept rising through the spring and early summer, even though historically prices tend to decline after the end of the heating season. However, as of the time of this writing, the market prices have dropped by more than 50% from a high of \$13.00 in early July 2008. Demand, oil price volatility, the global economy, electric generation, opportunities to take advantage of new extraction technologies, hurricanes and other weather activity will continue to impact natural gas prices for the foreseeable future. It is impossible to accurately predict what future natural gas prices will be. However, Cascade has considered price forecasts from several sources, such as Wood Mackenzie, Energy Information Agency, the Texas Comptroller's forecast, as well as our observations of the market to develop our low, base and high price forecast. Details of our price forecast can be found in Appendix E-3.

### Development of a Henry Hub price forecast

**Current Market:** Since pricing on the market is heavily influenced by Henry Hub prices, we closely monitor the market trend. As we developed the price forecast for the IRP, the market was in the process of falling after reaching the highs of July. While not a guarantee of where the market will ultimately finish, it is the most current information available that provides some direction as to future market prices. On a daily basis, we can see where Henry Hub is trading and how the future basis differential in our physical supply receiving areas (Sumas, AECO, Rockies) is trading.

**Wood MacKenzie:** Wood MacKenzie publishes a long-term price forecast each quarter to subscribing customers. This forecast is broken down by month through the planning horizon and includes Henry Hub as well as basis differentials for our receiving areas.

**Energy Information Administration (EIA):** We utilized the EIA price forecast. It should be noted that EIA's forecast is not always as current as the most recent market activity. Further, EIA forecast provides monthly breakdowns in the short term, but longer term forecast are by year. Given Cascade's load profile and the need for more winter gas than summer, we develop a pattern based on the market monthly forward prices to create a long-term, monthly Henry Hub price.

**The Texas Comptroller forecast:** Similar to EIA, this price forecast is available by year through the planning horizon, but monthly breakdowns are not available. We use a similar method as with the EIA to develop a monthly price forecast.

With a monthly Henry Hub price determined for the above sources, we assigned a weight to each source to develop the monthly Henry Hub price forecast for the planning horizon. At the time the price forecast was developed the Texas Comptroller forecast was significantly lower than the Wood MacKenzie forecast and the forward market. Given the significantly higher future prices at the time versus the Comptroller forecast, we decided to exclude the Texas Comptroller from our weighted average. Consequently, they were given a weight of zero. In recently years, EIA forecast has often been lower than the final monthly price, but it is still a respected industry barometer of prices so they were given a weight of 30%. As we pointed out before, while current market is not necessarily going to accurately predict the final market price, it is often a

## SUPPLEMENTAL INFORMATION REGARDING THE DEVELOP OF THE NATURAL GAS PRICE FORECAST

reliable indicator; therefore we gave our market assessment (the previous 60 days Henry Hub) 10% weight. As the most recent forecast of information with the most level of detail (including monthly basis forecast), Wood MacKenzie was assigned the remaining 60%.

### Development of the Basis Differential for Sumas, AECO and Rockies

Since our physical supply receiving areas (Sumas, AECO, and Rockies) are at a discount to Henry Hub, we utilize the basis differential from Wood Mackenzie's prior two quarterly updates and compare that to the future markets basis trading as reported in public market. Although it is impossible to accurately predict the future, for trading purposes, the most recent period has been the best indicator or the direction of the market. Correspondingly, we applied a weighted average to determine the individual basis differential in the price forecast. Typically, the most current Wood MacKenzie differentials are weighted at 60%. The differentials from the second most recent Wood MacKenzie forecast are weighted at 40%. However, at the time of the forecast was developed, the basis differential between the two forecast reports were radically different for the Rockies. Consequently, we decided to give even greater weight to the more recent update (75%) and 25% to the second most recent Rockies differential forecast. The differential for AECO and Sumas in the two most recent Wood MacKenzie reports were more in-line. Therefore, these were weighted at 60% for the most recent report of AECO and Sumas, while the second most recent report for the two basins was weighted at 40%.

### Looking ahead

Cascade continuously seeks to find additional market intelligence to assist in developing the price forecast. For example, the sources of the price forecast now include Financial Forecast Center. Prior to 2005, The Financial Forecast Center was a service of Market Research International and Applied Reasoning, Inc. Financial Forecast Center, LLC was split off from Applied Reasoning, Inc. in 2005 to focus on the creation and publishing of market forecasts while Applied Reasoning, Inc. focuses on the development of artificial intelligence software. We will be looking other resources, both public and private.
