In the Matter of IDAHO POWER COMPANY Request for a general rate revision OPENING TESTIMONY OF THE CITIZENS' UTILITY BOARD OF OREGON

Our names are Gordon Feighner and Bob Jenks, and our qualifications are listed in
 CUB Exhibit 101.

3 I. Introduction

CUB submits its Opening Testimony in this docket with the knowledge that all
issues presented by Idaho Power Company (hereafter, "Idaho Power" or "the Company")
in its initial filing are on the table. The first round of settlement negotiations on
November 21 and 22 ended without the parties reaching even a partial settlement of the
issues.

9 CUB's testimony in this docket will focus on several topics. Section II will 10 address the general upward trend of Idaho Power's rates and the negative impact that 11 these increases are having on Oregon ratepayers. Section III will discuss the Company's 12 proposed rate spread and rate design and CUB's opposition to Idaho Power's proposed 13 seasonal rate structure. Section IV will address CUB's proposed adjustments, including the Company's proposed increase in its rate of return; the Company's allocation
methodology for its distribution system; the Company's treatment of capital investments
in clean air compliance at its coal plants; the Company's director and officer insurance;
the Company's structure for wages and salaries; and the Company's methodology for
allocating expenses and benefits related to Advanced Metering Infrastructure (AMI).
Section V concludes the testimony and includes a summary of CUB's adjustments.

7

II. Idaho Power's Rates Are Increasingly Unaffordable

Idaho Power provides electric service in a relatively poor part of Oregon. The 8 median household income in Ontario is \$35,661, well below the state median household 9 income of \$50.166.1 Nevertheless, Idaho Power's residential customers in Oregon have 10 been subjected to significant rate increases the past few years. CUB Exhibit 102 shows 11 that the Company's average residential customer in Oregon has seen a cumulative rate 12 increase of over 36% since 2008. In 2010 alone residential rates increased by 27.53%. 13 Oregon rates are now higher than those in Idaho, even though load growth in Idaho has 14 15 been the driver of the Company's costs for years (this will be addressed further in Section III, below). It would be extremely difficult for customers to swallow yet another 16 significant increase such as the one proposed in this docket. 17 The most dire consequence of Idaho Power's continually increasing rates has 18

18 The most dife consequence of idano Power's continuarly increasing rates has 19 been the marked increase in the number of customers who have had their electricity 20 service disconnected due to nonpayment. CUB Exhibit 103 shows the number of 21 customer disconnections each month in Idaho Power's Oregon and Idaho service 22 territories from 2008 to 2011. In 2011, the monthly average so far in Oregon is 85

¹ <u>http://www.city-data.com/city/Ontario-Oregon.html</u>.

disconnections, which is an increase from an average of 58 in 2008.² Disconnections in 1 Idaho, meanwhile, have remained relatively stable. Even given the limited sample size, 2 an increase of more than 30% in disconnections in Idaho Power's relatively small Oregon 3 service territory indicates that a considerably higher number of customers are having 4 difficulty paying their electric bills this year. Even more alarming is the fact that as 5 shutoffs in Oregon have increased, the number of Oregon customers receiving energy 6 assistance through Project Shares has decreased and is now approximately half of what it 7 was in 2007-08.³ 8

9 The amount of customer arrearage is also increasing, meaning customers are 10 finding it more difficult to keep up with payments. CUB Exhibit 103 shows that the 11 average amount owed by Oregon customers at the time a disconnection notice was issued 12 was \$175 in 2008.⁴ That number has climbed steadily over the past few years, and the 13 average amount owed in 2011 is \$247, an increase of over 41%. It is clear that Idaho 14 Power's rate hikes are outpacing the rate of inflation and are becoming increasingly 15 difficult to manage for the Company's Oregon customers.

16

III. Residential Rate Design

Idaho Power is proposing several changes to rate design in Oregon. First, the
Company is proposing an increase in the customer charge from \$8/month to \$10/month.⁵
Second, it is proposing to increase the amount of usage available in the first tier of usage
from 300 to 1,000 kWh/month.⁶ Third, it is proposing to impose a seasonal rate structure
that will result in higher summer rates for residential customers in the months of June,

² CUB Exhibit 103, page 3-4.

³ See CUB Exhibit 104.

⁴ CUB Exhibit 103, pages 13-15.

⁵ Idaho Power / 1100 / Nemnich / 5.

⁶ *Ibid.*, page 6.

- ¹ July and August.⁷ CUB will address the seasonal rate issue first, since its views on the
- 2 other issue grow out of concerns over seasonal rates.

3 A. Seasonal Rates

- 4 Idaho Power makes two justifications for a significant increase in summer rates.
- 5 The Company claims that seasonal rates will both send a correct price signal and
- 6 encourage customers to use energy more efficiently:

7 My proposal supports the continuation of tiered rates and the 8 implementation of seasonal rates, both of which encourage customers to 9 use energy more efficiently in response to the appropriate price signals.⁸

10 And:

11 The current residential rate design, which does not include a seasonal 12 component, does not provide customers with any indication that the costs 13 incurred by the Company to provide them energy service during the three 14 summer months are significantly greater than the nine non-summer 15 months.⁹

16 *i.* UM 1415

- 17 Earlier this year, the PUC opened up a new phase of UM 1415 to investigate how
- 18 to evaluate proposals for mandatory time-varying rates, such as seasonal rates. The
- 19 proposal from the Commission listed a series of factors to be used to create an analytical
- 20 framework for considering such rates, as well as a series of directives to utilities to ensure
- 21 that such programs are being considered:

The factors in the straw proposal are intended to create a broad analytical framework for approving or rejecting a mandatory time-varying rate proposed by a party in a general rate case or other tariff filing. The directives are distinct from the factors. They are intended to create a process by which the Commission is assured that electric utilities, with input from Staff and stakeholders, are systematically evaluating promising time-varying rate designs or programs, and the costs and benefits of those

⁸*Ibid.*, page 3.

⁷ *Ibid.*, pages 7-8.

⁹ *Ibid.*, page 8.

1 2 3 4 5 6	rates and programs. Just because a rate is evaluated does not mean it will be proposed by a party or approved by the Commission. The Commission also clarified that this evaluation process does not necessarily need to occur as part of the Integrated Resource Planning (IRP) process. Moreover, the evaluation of time-varying rates need not be limited to mandatory rates. ¹⁰
7	In that proceeding, Idaho Power, CUB, Staff, and many other parties weighed in
8	on how the Commission should consider time-varying rates. A decision has not been
9	reached in that docket, and CUB believes that it is premature to move forward with a
10	seasonal rate proposal before the Commission has ruled on the factors it would like to
11	consider.
12	CUB believes that Idaho Power has failed to address the correct factors in its
13	proposal for seasonal rates. In the first Straw Proposal, the Commission identified the
14	following factors for consideration:
15 16 17	F-1. The amount of demand-side resource and system benefits that can be tapped through a time-varying rate.
18 19 20	F-2. The extent to which an optional rate or alternative program can achieve that resource.
21 22 23 24	F -3. The impact on customers of the proposed rate (<i>e.g.</i> rate shock, bill impacts on vulnerable populations) and the ability of customers to respond to those impacts.
25 26 27 28 29	F-4. The means available to mitigate impacts on customers (<i>e.g.</i> phasing in of rate differentials, opt-in and opt-out provisions, providing programmable equipment or software to enable customers to respond more easily).
30 31 32	F-5. The direct costs of implementing time-varying rates (<i>e.g.</i> IT costs, accounting).
33 34	F-6. The ability to explain and communicate the rate to customers.

¹⁰ UM 1415, Memorandum, September 30,2011, page 1.

- F -7. The cost differential between the relevant time periods, how robust the cost studies are, and whether customer response to the time-varying rate is expected to affect the cost differential over time.¹¹
- 4 5

Parties also suggested other factors in the proceeding. CUB suggested the

- 6 following factors should be considered:
- Arrearages. Arrearages are the measure of how far customers are 7 ٠ behind on their bills. Looking at whether arrearages are growing on an 8 annual basis, and how they change each month, can help provide an 9 indication about affordability. Arrearages that are growing from year 10 to year indicate that customers are generally having trouble keeping up 11 with the rates charged by the utility. Increases that are associated with 12 particular months indicate which bills create the largest affordability 13 problems. 14
- Shutoffs. Shutoffs ultimately grow out of arrearages, but they provide
 a different metric. When shutoffs are growing (as they currently are
 across all three electric utilities), it is a sign that care must be taken
 before raising the cost of monthly bills.
- Relationship of median household income to electric bills. How much are the costs at issue rising as compared to incomes? This is a classic way to assess the affordability of rates. The best metric for this, in CUB's opinion, is to look at the percentage of household income which would go to electricity if the house had median income and average usage.
- Correlation between forecasted peak costs and actual peak costs. 25 • As discussed in CUB's opening comments and at the Commission 26 workshop, hydro conditions have a large effect of summer energy 27 costs in the region. Since costs are set on a forecasted basis and it is 28 difficult to forecast the variability of hydro conditions, there should be 29 30 an assessment of how often and how close the forecasts are to reality. While the goal may be to set price signals that reflect costs, the 31 evidence might suggest a forecasted rate will only reflect actual costs 32 on a random basis. 33
- Load shape of Customer class. Residential customers are winter
 peaking for all three electric utilities. As mandatory time-varying
 pricing is considered the Commission should examine load shapes to
 determine whether the problem being addressed is significant or not,
 and whether the proposed solution will have an effect.
- Customer growth. Customer growth is a very real driver of higher
 energy costs and a large part of what is causing rates to increase faster
 than incomes. The Commission should look at how customer growth is
 driving the costs of the utility before raising the bills of customers who

¹¹ UM 1415, OPUC Order No: 11-255, Attached Straw Proposal, page 1.

1 2 3	are paying significantly higher rates due to this load growth, but are not themselves contributing to the load growth. ¹²
4	Idaho Power has made no attempt in its filing to systematically address the factors
5	listed in the straw proposal by the Commission or the factors proposed by CUB and other
6	parties in their comments on the straw proposal. Instead, Idaho Power essentially claims
7	that because its marginal cost study shows higher summer costs, that fact alone justifies
8	seasonal rates. The other factors are ignored.
9	ii. Higher Summer Costs
10	Idaho Power claims that its seasonal rate proposal simply reflects higher costs in
11	the summer months:
12 13 14 15 16 17 18 19	Idaho Power continues to be a summer peaking utility with its highest system peak occurring during the summer months. The unit costs resulting from the Company's proposed cost-of-service study indicate that the residential kilowatt-hour unit cost is approximately 61percent higher in the summer than for the non-summer months. In fact, the unit cost differential for the generation function alone, as provided by the marginal cost allocation methodology described by Mr. Larkin, results in a summer differential of more than 127 percent over the non-summer months. ¹³
20 21 22 23 24	And: As shown in Mr. Larkin's Exhibit 1006 on page 2, and discussed on page 7 above, the summer season cost-of-service unit costs for energy are much higher than the non-summer seasonal cost-of-service unit costs for energy. ¹⁴
25	But page 2 of Mr. Larkin's Exhibit 1006 is not so clear cut. First, it shows that the
26	Company's per-unit energy costs are <i>lower</i> in the summer than the winter. Energy in the
27	summer has a unit cost of \$.02309, where energy in the non-summer months has a unit
28	cost of \$0.2457. This is not surprising, since Idaho Power is a hydro utility and there is a
29	great deal of low-cost hydro power being produced during the summer months. It is the

¹² UM 1415, Reply Comments of Bob Jenks on Behalf of CUB, page 10-11.
¹³ Idaho Power / 1100 / Nemnich / 7.
¹⁴ Idaho Power / 1100 / Nemnich / 10.

1	capacity (or demand) costs where the Company claims higher costs. Demand in the
2	summer has a unit cost of \$.05264 versus \$0.00870 in the non-summer months.
3	a. Summer Energy Costs
4	Idaho Power is a hydro utility and has a great deal of hydro generation that is
5	available in the summer, resulting in lower generation costs during those months in most
6	years. CUB Exhibit 105 shows Idaho Power's hydro generation over the last five years.
7	In four of those years, hydro production peaked in June. In three of the five years, July
8	was the third most productive month for hydro power. Hydropower is Idaho Power's
9	least cost resource and, as shown in CUB Exhibit 105, is readily available in the summer
10	months. Customers have paid for the rate base associated with this generation, and to the
11	degree it is being produced in the summer, it should be available for customers to use.
12	b. Summer Capacity Costs
13	Idaho Power also claims to have higher capacity costs in the summer months. ¹⁵
14	These costs, however, reflect the resource decisions that Idaho Power has made to serve
15	growing load in Idaho, not the cost of serving Oregon's winter-peaking residential load.
16	CUB Exhibit 106 shows mid-C high load hour prices for 2010 and 2011. In both
17	cases August is the higher cost month, but June and July are lower than September in
18	both years. In 2011 July prices were also lower than November prices. The difference
19	between these costs and the demand costs listed in Idaho Power's case is the difference
20	between the short-run marginal costs of demand and the long-run marginal costs of
21	demand.
22	Idaho Power's IRP makes clear that the long-run cost of capacity is driven by load

²³ growth, which has occurred almost completely in Idaho. Since 1990, Idaho Power's retail

¹⁵ Idaho Power / 1100 / Nemnich / 8.

1	customers have grown by 68%, from 292,000 to 492,000. ¹⁶ Each new residential
2	customer requires a capital investment of \$1,800 in energy and \$4,000 in capacity. ¹⁷ Of
3	these 200,000 new customers added since 1990, only $1,625 - less$ than $1\%^{18} - were$
4	added in Oregon. ¹⁹ This means that while Oregon makes up a little under 4% of Idaho
5	Power's total customer count, ²⁰ it has accounted for less than 1% of the load growth over
6	the last 20 years, and thus less than 1% of these extraordinary capacity costs. Load
7	growth over this period has caused the need for expensive capacity resources. Idaho
8	Power charges higher rates to its Oregon residential customers, even though it is load
9	growth in Idaho that is driving costs. Instead of summer rates, Oregon should be asking
10	Idaho Power to allocate the cost of load growth to the jurisdictions that are growing. It is
11	time for Oregon customers to stop subsidizing Idaho.
12	iii. No Evidence Seasonal Rates Will Reduce Demand
13	The first factor proposed by the Commission in UM 1415 is related to demand
14	response: "[t]he amount of demand-side resource and system benefits that can be tapped
15	through a time-varying rate." ²¹ Idaho Power already has seasonal rates for residential
16	customers in Idaho. ²² CUB Exhibit 107 is Idaho Power's response to CUB Data Request

20. CUB requested "any evidence" that seasonal rates were reducing peak loads in Idaho. 17

The Company's answer was that it has no evidence that seasonal rates reduce load. 18

²² Idaho Power / 1100 / Nemnich / 8.

iv. Evidence That Seasonal Rates Will Harm Customers 1

2	CUB believes there are two big questions regarding time-varying rates. The first
3	question is whether such rates bring benefits to the system. CUB finds that in this case,
4	there is no evidence to support such a finding. The second question is whether such rates
5	are likely to harm customers. There is a great deal of evidence to support the notion that
6	seasonal rates are harmful to customers, some of which has already been shown in this
7	testimony. Residential rates have been increasing and shutoffs and arrearages have
8	surged. But there is also evidence that points to problems with seasonal rates, not just
9	rates in general.
10	CUB Exhibit 103 contains a wealth of data that demonstrates the level at which
11	Idaho Power's Oregon customers are struggling. It is clear from this Exhibit that
12	customers are having trouble paying summer cooling bills. Shutoff notices and
13	disconnections for nonpayment typically increase through the winter and peak just after
14	the winter in the March and April period. This is due to the time lag it takes before
15	customers fall 60 or more days behind on their bill. In 2008 and 2010, there is clearly a
16	second peak of disconnection notices in the September and October period, which
17	follows the summer cooling season. ²³ In 2008, October was the peak month for
18	disconnection notices. In 2010, September and October were the top two months for
19	disconnection notices. This trend follows into disconnections. In October 2010, 104
20	Oregon customers were disconnected in October. This year, 109 Oregon customers were
21	disconnected in August. ²⁴

²³ CUB Exhibit 103, pages 1-3. ²⁴ *Ibid.*, pages 3-4.

1	These numbers clearly show that higher summer rates will cause harm to
2	customers. Customers are already struggling to pay for the cost of cooling their homes in
3	the summer, and increasing that cost by a significant amount will only increase the
4	problem.
5	v. Air Conditioning Customers
6	Staff has argued that customers with air conditioning need to be charged more for
7	electricity out of a principle of fairness and equity:
8 9 10 11 12 13	Staff was mindful of this principle when advocating summer-seasonal rates for Idaho Power's Oregon residential customers in Docket UE 213. Staff assumes a high correlation of natural-gas-heating central air-conditioned customers with higher income customers and of swamp-cooling, electric-resistance-heating customers with lower income customers. ²⁵
14 15	But the data concerning shutoff notices and disconnections suggests that Staff's
16	assumption might not be correct. CUB argued in UE 213 that there was not a great deal
17	of natural gas service in Idaho Power's service territory and that much of the air
18	conditioning load was in fact not high income customers but customers who live in
19	manufactured homes. ²⁶ According to Consumers Union, "[A]lmost all mobile homes
20	have forced-air heating and air conditioning." ²⁷
21	CUB asked Idaho Power about the number of manufactured homes in its Oregon
22	service territory, and even we were surprised by the answer: 21% of the Company's
23	Oregon customers live in a manufactured or mobile home. ²⁸ Most of these manufactured
24	homes are not new – there has been little new customer growth in Oregon for 20 years.
25	This means that most of these manufactured homes are likely not very efficient.

²⁵ *Ibid*, page 3.
²⁶ UE 213 / CUB / 100 / Jenks / 3.
²⁷ http://www.consumersunion.org/other/mh/brochure.htm.
²⁸ See CUB Exhibit 108.

1 **B.** Customer Charge

CUB opposes Idaho Power's proposal to increase the monthly residential customer 2 charge from \$8 to \$10. This proposal would increase costs on low use customers and runs 3 counter to Idaho Power's claimed need to reflect higher costs in energy prices and 4 encourage more efficient use of electricity. CUB believes that keeping the focus on cost 5 6 recovery through volumetric rates and rejecting seasonal rates is the approach that strikes the best balance between volumetric price signals and helping customers manage bills. 7 8 CUB therefore respectfully requests that the Commission leave the monthly customer 9 charge unchanged at \$8/month.

10 C. Tiered Rates

CUB generally supports moving the tiers between residential rate levels from 300 11 kWh/month to 1000 kWh/month. Such a move would better reflect a difference between 12 basic electricity use and electricity use that includes heating and cooling. However, CUB 13 14 recognizes that with shutoffs and arrearages on the increase, such a move can only be made if it does not create rate shock for a significant number of customers. Recognizing 15 that Staff will likely weigh in with a different rate design and the revenue requirement 16 17 will likely be lower than Idaho Power requested, it is difficult to know whether such a 18 change will cause rate shock to customers at some usage levels.

19 CUB recommends that the tier between rate levels for residential customers be 20 increased from 300 to 1000 kWh/month. This recommendation is contingent upon the 21 assumption that the Commission will find that, based on the revenue requirement and 22 other rate design elements, such a change in the tier levels can be accomplished without 23 causing rate shock to customers with some usage levels.

IV. CUB's Proposed Adjustments 1

CUB proposes a number of adjustments to Idaho Power's revenue requirement 2 3 based on a review of the Company's initial filing and its responses to data requests from intervenors. 4

5 A. Rate of Return

Idaho Power certainly cannot be accused of a lack of audacity in its proposal to 6 7 increase its rate of return in this docket. Idaho Power witness Steven Keen argues at length in his testimony that the Company's allowed Return on Equity (ROE) should be 8 increased to 10.5%.²⁹ Keep in mind that this request follows on the heels of an allowed 9 ROE of 10.175% that was set in Docket UE 213 and became effective on March 1, 10 2010.³⁰ Given that the Company's initial filing in this docket was dated July 29, 2011, 11 this means that after little more than one year of operation under a 10.175% ROE Idaho 12 Power feels it is appropriate to seek another increase that will result in increased profits 13 for the Company with a corresponding increase in rates for its already struggling 14 15 customers. Surely even Idaho Power has noticed that its customers cannot afford another rate increase. 16

Idaho Power claims a number of issues are combining in the current economic 17 climate that increase its operational risks. While times may arguably be difficult for the 18 Company, there is no denying that times are worse for many of its customers. Idaho 19 Power's Oregon service territory is one of the poorest parts of the state, and there has 20 been little in the way of economic development in recent years. The fact that electricity 21

 ²⁹ Idaho Power / 500 / Keen / 4.
 ³⁰ Order No. 10-064, page 3.

rates for the average residential customer have increased by over 36% since 2008³¹
continues to make things harder for the people who live in the Company's Oregon service
territory. Further increasing rates to fund an increase in the Company's allowed ROE will
exacerbate the already existing level of rate shock.

The Company also cannot have failed to notice that other utilities in other states 5 are not obtaining ROEs greater than 10% any more. PacifiCorp's most recent general rate 6 case in the state of Washington resulted in that company receiving an allowed ROE of 7 9.8%.³² This has been true of other utilities in other states, too. CUB Exhibit 109 contains 8 a table summarizing a number of recent Commission decisions from around the country 9 that ordered ROEs below 10%. These decisions affect utility operations in 11 states. The 10 bottom line here is that many Commissions are recognizing that the cost of capital for 11 utilities has decreased during this economic downturn, thereby justifying lower utility 12 ROEs. 13

14 CUB respectfully requests that the Commission also recognize the effect that the 15 economic climate is having on the cost of capital and not approve Idaho Power's 16 proposed increase in ROE and instead adopt a reasonable level, commensurate with 17 current economic conditions, based on Staff's recommendations.

18

B. Allocation of Distribution Costs

Idaho Power's methodology for allocating the cost of line transformers results in Oregon customers subsidizing load growth in Idaho. CUB Exhibit 110 shows that the Company has been allocating the cost of line transformers in Account 368 based on the number of underground and overhead line miles, which places approximately 9.1% of the

³¹ See CUB Exhibit 102.

³² Washington Utilities and Transportation Commission, Docket UE-100749, Order No. 06.

1	cost of transformers on to Oregon customers. This makes little sense. Distribution plant
2	should be directly assigned to the state where the distribution plant is located. There is no
3	reason to allocate distribution plant because such plant is not shared between the states.
4	There are several reasons to believe that allocating the cost of line transformers
5	based on conductor miles assigns Oregon an unfair share of the total costs.
6 7 8 9 10 11 12 13 14 15 16 17	 Idaho Power's service territory in Oregon is growing much more slowly than its territory in Idaho. Since 1990, Oregon represents less than 1% of the customer growth of the system.³³ Customer growth is the biggest driver of investment in the distribution system, including line transformers. With Oregon representing less than 1% of the growth, it is safe to assume that not many new transformers are being installed in Oregon. Oregon's land use planning laws and rules place restrictions on building outside of urban growth boundaries. By limiting the number of buildings that may be developed in farm and forest lands, Oregon limits the need for additional line transformers.
 18 19 20 21 22 23 	• While Idaho Power's service territory in Oregon is rural, much of the housing is located in relatively dense enclaves within that area. More than 20% of the Company's Oregon customers live in mobile and manufactured housing. ³⁴ When housing is compact, one line transformer can serve several homes.
24	CUB recommends that until the Company can demonstrate that it is directly
25	assigning the cost of line transformers to the state where the transformer is located, the
26	Commission should limit the assigned Oregon costs to no more than 1% of the total cost
27	of line transformers, which is a little greater than Oregon's share of system load growth.

 ³³ LC 53, Idaho Power 2011 IRP, page 23.
 ³⁴ CUB Exhibit 108.

C. Clean Air Compliance Costs 1

2	CUB had been under the impression that the total cost of emission control
3	technology placed into service during the test period was limited to a few thousand
4	dollars. However, Idaho Power's Errata Exhibit 901 (filed on December 2, 2011)
5	indicates that over \$8 million in investments in emission control upgrades at the Jim
6	Bridger coal plant went into service in July 2011. ³⁵ The Company's initial filing indicated
7	an in-service date for this investment of July 2008, so CUB did not previously feel the
8	need to thoroughly investigate this expenditure.
9	This error is troubling to CUB. For such a large adjustment to be made evident
10	only a few days before the deadline for intervenor testimony places CUB in the position
11	of not being able to fully review the prudency of the investment. As such, CUB has no
12	choice but to request that the Commission disallow Idaho Power's investments in
13	emission control upgrades at the Jim Bridger plant for the Company's failure to
14	demonstrate prudence. The total investments placed into service in 2011 in the project

(Project ID B00900447) amount to \$8.2 million on a system basis. Assuming a 4.88% 15 capital allocation factor, CUB recommends an Oregon adjustment of \$402,000 to rate 16 17 base.

18

D. Director and Officer Insurance

Idaho Power purchases three tiers of insurance for directors and officers. This 19 insurance is primarily used to shield directors and officers from lawsuits filed against the 20 Company's management by shareholders. It is reasonable for the Company to provide a 21 standard, primary insurance policy for these executives that is assessed to customers, as 22

³⁵ Idaho Power / 901 / Noe / 2, line 42 (Errata).

1	this policy helps to protect customers from the risk of having to pay for legal settlements.
2	Idaho Power, however, also provides two additional (excess) tiers of insurance for
3	executives. CUB contends that the expense of these two layers should be shared equally
4	between customers and shareholders, as shareholders both benefit from protection from
5	lawsuits and are more than likely to be the recipient of any payout from this insurance.
6	Since half of the expenses for the first and second layers of executive insurance should be
7	disallowed, CUB recommends an adjustment of \$350,000 on a system basis. Applying a
8	4.58% labor allocation factor results in an Oregon adjustment of \$16,000. ³⁶
9	E. Wages and Salaries
10	Idaho Power's wage and salary expenses continued to grow in 2011, despite a
11	relative lack of growth in customer base and load. CUB Exhibit 112 is Idaho Power's
12	response to Staff Data Request 94. This response details the Company's annual actual
13	wage and salary expenses for the years 2007-2011. CUB notes a few disconcerting trends
14	in this data. First and foremost, total wage and salary expenditures increased more than
15	16% from 2007 to 2011, while the total number of FTEs increased by only around 2%.
16	Furthermore, the Company had claimed that its investment in AMI would result in lower
17	payroll expenses and a smaller staff. Instead, the number of FTEs has increased by nearly
18	100 from 2009 to 2011, again during a period of very low load growth. For the above
19	reasons, CUB proposes a significant adjustment related to meter reading labor costs in
20	Section E below.
21	Another aspect of Idaho Power's wage and salary expenses that is of concern to

22 CUB is the relatively high number of executive officers retained by the Company. CUB

³⁶ See CUB Confidential Exhibit 111.

1 Exhibit 113 details CUB's calculations on this issue. This filing indicates that Idaho Power has 16 executive officers on its payroll in 2011, up two from previous years. PGE 2 and PacifiCorp, for comparison, have significantly fewer officer positions, even though 3 those companies are larger and serve more customers. Given the above, CUB 4 recommends that the Commission disallow 25% of the wage and salary costs for Idaho 5 6 Power's officers so as to effectively reduce the number of officers at Idaho Power to that of PGE (a reduction from 16 to 12). CUB thinks this is generous given that Idaho Power 7 8 is a smaller utility. This adjustment totals \$1 million on a system basis, and \$49,000 on 9 an Oregon allocation basis after accounting for the division of executive salaries between O&M and Capital.³⁷ 10

11

F. AMI System Operations Benefits

Idaho Power recently completed the upgrade of its meters in Oregon to AMI. The new infrastructure should realize significant savings in costs associated with labor, transportation, and O&M. The Company estimates that AMI enabled it to achieve significant savings in operational costs for 2011.³⁸ Upon review of documents provided by the Company, CUB finds additional savings that should be able to be achieved in meter reading operations.

CUB Exhibit 114 contains part of Idaho Power's response to Staff Data Request 343. The Company's Third Supplemental Response included the spreadsheet that contained the data in this exhibit. Idaho Power continues to model significant costs related to meter reading and transportation, even though the installation of AMI is largely complete and these costs should have been nearly eliminated. Nevertheless, annualized,

³⁷ See CUB Exhibit 113.

³⁸ Idaho Power / 300 / Kline / 5.

levelized costs from these two expenditures remain and are expected to increase in future
 years. CUB respectfully recommends that the Commission remove the entirety of Idaho
 Power's labor and transportation costs related to meter reading. The levelized costs are
 \$5.6 million for labor and \$1.1 million for transportation. Using allocation factors for
 labor and O&M for Oregon, the total requested adjustment is \$309,000.

6 V. Conclusion

18

19

7 CUB is concerned about the impact of yet another rate increase on Idaho Power's Oregon customers. In a time when economic difficulties are lowering the cost of capital, 8 9 it is difficult to justify awarding the Company a higher ROE. When Oregon residential customers are winter-peaking and do not drive Idaho Power's summer peak, it is also 10 difficult to justify adopting a new seasonal rate structure. And it is difficult to justify 11 12 increasing the monthly customer charge when energy conservation is a stated goal of the utility. In addition to opposing these proposals from the Company, CUB also 13 14 recommends that the Commission make the following adjustments to Idaho Power's 15 Oregon revenue requirement: 16 Remove \$402,000 from clean air capital expenditures • Remove \$16,000 from director and officer insurance expenses 17 •

- Remove \$49,000 from executive compensation
- Remove \$309,000 from meter-reading expenses due to savings from AMI

WITNESS QUALIFICATION STATEMENT

- NAME: Bob Jenks
- **EMPLOYER:** Citizens' Utility Board of Oregon
- **TITLE:** Executive Director
- ADDRESS: 610 SW Broadway, Suite 400 Portland, OR 97205
- **EDUCATION:** Bachelor of Science, Economics Willamette University, Salem, OR
- **EXPERIENCE:** Provided testimony or comments in a variety of OPUC dockets, including UE 88, UE 92, UM 903, UM 918, UE 102, UP 168, UT 125, UT 141, UE 115, UE 116, UE 137, UE 139, UE 161, UE 165, UE 167, UE 170, UE 172, UE 173, UE 207, UE 208, UE 210, UG 152, UM 995, UM 1050, UM 1071, UM 1147, UM 1121, UM 1206, UM 1209, and UM 1355. Participated in the development of a variety of Least Cost Plans and PUC Settlement Conferences. Provided testimony to Oregon Legislative Committees on consumer issues relating to energy and telecommunications. Lobbied the Oregon Congressional delegation on behalf of CUB and the National Association of State Utility Consumer Advocates.

Between 1982 and 1991, worked for the Oregon State Public Interest Research Group, the Massachusetts Public Interest Research Group, and the Fund for Public Interest Research on a variety of public policy issues.

MEMBERSHIP: National Association of State Utility Consumer Advocates Board of Directors, OSPIRG Citizen Lobby Telecommunications Policy Committee, Consumer Federation of America Electricity Policy Committee, Consumer Federation of America

	Between 2004 and 2008, I worked for the US Environmental Protection Agency and the City of Portland Bureau of Environmental Services, conducting economic and environmental analyses on a number of projects. In November 2008 I joined the Citizens' Utility Board of Oregon as a Utility Analyst and began conducting research and analysis on behalf of CUB.	

UE 233 - CUB WITNESS QUALIFICATION STATEMENT

CUB'S DATA REQUEST NO. 12:

Refer to Idaho Power / 200 / Anderson / 18. Please provide the top graph on the page with the addition of lines charting the growth in Idaho Power's Oregon rates and the growth of average annual income for Oregon residents.

IDAHO POWER COMPANY'S RESPONSE TO CUB'S DATA REQUEST NO. 12:

The table below reflects the average annual mills/kWh and percent change for an Oregon residential customer using 1,240 kWh per month. Idaho Power is not in possession of the average annual income for Oregon residents.

Year	Average Mills/kWh	Percent Change
2005	48.39	
2006	49.02	1.30%
2007	49.02	0.00%
2008	52.07	6.23%
2009	55.56	6.70%
2010	70.85	27.53%

CUB'S DATA REQUEST NO. 27:

Please provide the following information by month and annual average for residential customers for the calendar years 2008, 2009, 2010, and 2011 to date, separately for both Oregon and Idaho:

- a. Number of disconnection notices issued;
- b. Number of actual disconnections for nonpayment;
- c. Number of payment plans entered into with installment payments of the arrears balance plus the current bill;
- d. Number of payment plans entered into with equal monthly payments, including budget payment plans;
- e. Number of residential customers receiving federal or state bill paying assistance;
- f. Average dollar amount of overdue balance for customers who receive a disconnection notice;
- g. Average dollar amount owed at time of disconnection for nonpayment;
- h. Average amount owed at time of reconnection of service following disconnection for nonpayment;
- i. Information on f, g, and h for identified low-income customers;
- j. Total cumulative arrearage for residential customers.

IDAHO POWER COMPANY'S RESPONSE TO CUB'S DATA REQUEST NO. 27:

a. The following data details the number of 5-day, or final, disconnection notices issued:

- h. This information is not available.
- i. Idaho Power does not track income status; therefore, information for low-income customers is not available.

j. Total cumulative arrearage information for residential customers is included on the attached Excel file.

CUB'S DATA REQUEST NO. 14:

How many Oregon customers have received energy assistance through Project Share in each of the past five years for which data is available?

IDAHO POWER COMPANY'S RESPONSE TO CUB'S DATA REQUEST NO. 14:

Project Share energy assistance is tracked on an October 1 – September 30 basis. The information detailed below identifies the number of Project Share grants issued to Idaho Power customers in Oregon.

October 1 - September 30	# of Grants
2006-2007	71
2007-2008	76
2008-2009	56
2009-2010	39
2010-2011	39

CUB'S DATA REQUEST NO. 20:

Please provide any and all evidence showing that the Company's seasonal rate structure is reducing peak loads in Idaho.

IDAHO POWER COMPANY'S RESPONSE TO CUB'S DATA REQUEST NO. 20:

Idaho Power has not conducted a study examining, in isolation, seasonal rate impacts in part because all current rate designs have other components.

Idaho Power's primary reason for proposing seasonal rates is to send the appropriate price signals to customers. These seasonal rates better reflect the higher cost of providing energy in the summer season than during the non-summer months.

CUB'S DATA REQUEST NO. 21:

Please provide, to the best of the Company's ability, an estimate of the number of Oregon residential customers that live in manufactured housing.

IDAHO POWER COMPANY'S RESPONSE TO CUB'S DATA REQUEST NO. 21:

The percentage of Oregon residents living in mobile or manufactured homes can be estimated using Idaho Power's 2010 Residential End-Use Survey that was published as part of the Demand-Side Management 2010 Report, Supplement 2: Evaluation. Ten percent of Oregon survey respondents reported their type of residence as a mobile home while an additional 11 percent reported their type of residence as a manufactured home. Using the average daily residential customer count of 13,432 for December 2010, it is estimated that 2,820 Oregon customers reside in mobile or manufactured homes. A copy of Idaho Power's Demand-Side Management 2010 Report is provided in the Company's response to CUB's Data Request No. 10 above.

CUB EXHIBIT 111 IS CONFIDENTIAL SUBJECT TO PROTECTIVE ORDER NO. 11-288

August 30, 2011

Subject: Docket No. UE 233 Idaho Power Company's **Corrected** Response to Staff's Master Data Request 94

UE 233/CUB/112 Jenks-Feighner/1

An IDACORP Company

STAFF'S DATA REQUEST NO. 94:

WAGE AND SALARY DATA

For the test year and the preceding 4 calendar years, please provide (on a total company basis), a summary table (using the categories and format shown below) that includes the number of FTE's (exclude FTE's created by overtime hours) and the actual paid cash compensation broken down between base wages or salaries, overtime, and incentives or bonuses. For any calendar year included in this request for which actual data is not available for the entire calendar year, please create a calendar year using the available actual data combined with the forecast applicable to the rest of the year. Please note which months and figures are associated with both the actual and forecast data.

IDAHO POWER COMPANY'S CORRECTED RESPONSE TO STAFF'S DATA REQUEST NO. 94:

Please see the information on the following page. Please note the following:

- Salary data includes regular earnings, paid time off, and holidays.
- Headcount is as of December 30 of each year reported.
- Compensation figures include employees who terminated during the year.
- Employees retiring during the year are broken out separately. Any incentive payments to employees retiring in one year are paid in the following year.
- 2011 FTE figures include headcount expected through year-end 2011.
- 2011 Salary data includes forecast dollars for all employees on payroll as of June 30 through year-end; it does not include forecast dollars for employees that may be hired later in the year.
