Re: Docket UE 219—PacifiCorp's Compliance Filing

On July 29, 2021, the Public Utility Commission of Oregon (Commission) issued Order No. 21-242, adopting staff recommendations to approve PacifiCorp d/b/a Pacific Power's (PacifiCorp or the Company) Application for Approval of a Property Transfer Agreement with the Klamath River Renewal Corporation (KRRC), subject to the several conditions. Those conditions included the following three requirements regarding reports provided to KRRC and the states of Oregon and California (the States):

4. *PacifiCorp shall file in this docket any written report it provides to KRRC and the States regarding each Pre-Existing Environmental Condition, as such provision is required by Section 3.5(b). Each such written report is to be filed on the same date it is provided to KRRC and the States. Additionally, PacifiCorp is to file in this docket any updates to each report provided to KRR and the States under Section 3.5(b).*
5. *PacifiCorp shall file in this docket the report it is to provide KRRC and the States regarding the status of its efforts to resolve the Pre-Existing Environmental Conditions under Section 3.5(c) of the Property Transfer Agreement. This report is to be filed on the same date it is provided to KRRC and the States.*
6. *PacifiCorp shall promptly file in this docket its agreement with KRRC and the States regarding all Pre-Existing Environmental Conditions not resolved in accordance with Section 3.5 as of Closing; i.e., the "Retained Environmental Obligations" contemplated in Section 3.5(d)*

PacifiCorp recently discovered that three reports were submitted in 2023 to KRRC and the States; however, the reports were not filed in this docket. The Company submits this compliance filing to ensure the reports from 2023 are filed in docket UE 219 as required in Order No. 21-242.

- Attachment A - Supplement No. 1 to the Site Investigation Work Plan for Oregon and California (January 2023)
- Attachment B - Site Investigation Reports for Oregon and California (March 2023)
- Attachment C - Removal Action Plan for Oregon and California (September 2023)

The Company apologizes for this oversight and is taking steps to ensure future reports are filed in docket UE 219 the same day they are submitted to KRRC and the States.

If you have any questions matter, please contact Cathie Allen, Regulatory Affairs Manager, at (503) 813-5934.

Sincerely,

Matthew McVee
Vice President, Regulatory Policy and Operations

1. Introduction

As part of the Lower Klamath Hydroelectric Project (FERC No. P-14803), PacifiCorp and the Klamath River Renewal Corporation (KRRC) have entered into a legally-binding Property Transfer Agreement (Agreement) that identifies 17 pre-existing environmental conditions (PECs) located in the states of California and Oregon. All of the PECs are identified in Exhibit C of the Agreement.

While the Agreement and specifically Exhibit C discuss the resolution of PECs, the *Oregon Site Investigation Work Plan* (Oregon SIWP) (Jacobs 2021a) and this *Oregon Site Investigation Work Plan Supplement No. 1* (Oregon Supplement) refer to the Exhibit C items generically as recognized environmental conditions (RECs). Not all PECs in Exhibit C have been formally identified as a REC in a Phase I environmental site assessment (ESA).

PacifiCorp submitted the Oregon SIWP to the State of Oregon and the KRRC on November 16, 2021. On November 17, 2021, PacifiCorp submitted the Oregon SIWP to the Oregon Public Utilities Commission, as required in Order No. 21-242. The Oregon SIWP described the sampling activities to be performed to confirm the presence or absence of constituents of potential concern (COPCs) at concentrations greater than identified screening levels at the one REC located in Oregon – the J.C. Boyle Dispersed Recreation Area.

1.1 Purpose and Objectives

PacifiCorp retained Jacobs Engineering Group Inc. (Jacobs) to develop this Oregon Supplement and identify the process by which the remaining (i.e., not addressed in the Oregon SIWP) Exhibit C RECs located in Oregon will be brought forward for site assessment and closure. This Oregon Supplement incorporates the Oregon SIWP by reference and provides specific information necessary to address remaining RECs in accordance with the Oregon SIWP, which was approved by the KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021) and which was implemented when assessing the J.C. Boyle Dispersed Recreation Area (Jacobs 2021a).

The primary objective of this Oregon Supplement is to establish the means by which the remaining Exhibit C RECs located in Oregon will be assessed and closed per the Agreement. Secondary objectives are to identify the key environmental data that will support closure of the remaining seven RECs and outline the various sampling approaches for each REC so that as much analytical and field observational data as possible can be collected for REC closure under a single mobilization.

The field and analytical data will be used to determine and delineate the vertical and horizontal extent of potentially impacted soil, groundwater, or both, as needed, for REC closure. Waste characterization data will also be collected to help in planning a remedial action at a site. These data will be used to determine offsite disposal requirements and onsite waste segregation and management requirements for hazardous and nonhazardous waste, if encountered.

1.2 Recognized Environmental Conditions Addressed in This Oregon Supplement

The following seven Exhibit C RECs are addressed in this Oregon Supplement:[1]

- Condition 5 – Undiscovered Impacted Soil and Groundwater at the four Powerhouses

[1] The REC names in this list are verbatim from Exhibit C. Elsewhere in this Oregon Supplement, "high-voltage" is hyphenated when referencing Condition 8.

- Condition 6 – Underground Storage Tanks (USTs)
- Condition 8 – High voltage switchyards
- Condition 9 – Undiscovered Impacted Soil and Groundwater at the 4 Dam Developments
- Condition 15 – Inaccessible areas
- Condition 16 – Retained easement areas
- Condition 17 – Undiscovered Impacted Soil and Groundwater outside the removal work zone

These RECs (Figure 1-1) were not included in the Oregon SIWP because during Oregon SIWP development, the RECs were unknown, undiscoverable, or inaccessible or because REC-specific investigations could not be completed. For example: (1) Access to the J.C. Boyle switchyard (Figure 1-2) was determined to be especially hazardous since the high-voltage switchyard is active; and (2) Unknown areas remain unknown until decommissioning and demolition of the dam commences. To satisfy Agreement Section 3.5(c), this Oregon Supplement presents PacifiCorp's proposed approach to address the remaining Exhibit C RECs in a manner that will minimize disruption or delay of dam removal efforts by the KRRC and that will allow for expedited remediation or disposal of potential contaminants if identified during dam removal.

This Oregon Supplement proposes a sampling approach for the J.C. Boyle switchyard (REC 8) that includes a figure illustrating planned soil sample locations and a table identifying media to be sampled, sample collection depths, and laboratory analyses to be performed.

The RECs identified in this Oregon Supplement will be assessed by following the same processes, procedures, and standards that were approved for the Oregon SIWP.

1.3 Background

The Oregon SIWP (Jacobs 2021a) provides a detailed background of the J.C. Boyle Development, a complete list of the Exhibit C RECs, and a discussion of the surrounding lands and historical practices. The Oregon SIWP content is incorporated in this Oregon Supplement by reference.

Pertinent to the RECs addressed in this Oregon Supplement are the two Phase I ESAs conducted for the Oregon and California hydroelectric developments (AECOM 2018, 2020). Of the RECs identified by AECOM and documented in Exhibit C of the Agreement, PacifiCorp prepared an Oregon SIWP for the J.C. Boyle Dispersed Recreation Area (Jacobs 2021a). The RECs associated with Copco No. 1, Copco No. 2, and Iron Gate dams in California were addressed separately in a California SIWP (Jacobs 2021b).

The dams and associated powerhouses have been and continue to be operated to generate and distribute electricity until dam removal activities begin. Hazardous materials that have been used onsite include diesel fuel, leaded and unleaded gasoline, non-polychlorinated biphenyls (non-PCBs), and governor, transformer, and motor oils. Battery banks and oils are stored within secondary containment systems. As noted in the Phase I ESA conducted by AECOM, the powerhouses appeared to be in good operating condition, with proper housekeeping and hazardous materials management practices (AECOM 2018).

1.4 Investigative Standard and Future Uses

Notwithstanding any specific process or procedure identified in this Oregon Supplement, the work performed under this Oregon Supplement will be carried out in accordance with the Investigative Standard, as defined in Section 1.5 of the Oregon SIWP (Jacobs 2021a). Unlike the Oregon SIWP, this Oregon Supplement addresses multiple RECs, necessitating the identification of intended future uses and

exposure pathways at the remaining RECs (Table 1-1). The exposure pathways will be used to determine the screening levels that were developed in Section 3.3 of the Oregon SIWP (Jacobs 2021a). The analytical results from investigations at a REC will be evaluated against these screening levels to determine if the REC can be closed or if further assessment, remediation, risk assessment, or a combination are required.

Table 1-1. Site Future Uses and Exposure Pathways

Exhibit C REC No.	Site/REC	Site Future Use	Exposure Pathways
8	High-voltage switchyards (and substations)	Active recreation	Residential/leaching to groundwater
16	Retained Easements	Active Recreation	Residential/leaching to groundwater
15	Inaccessible Areas	Passive recreation/natural habitat	Residential/ecological/leaching to groundwater
6	Underground Storage Tanks	Active recreation	Residential/leaching to groundwater
5	Undiscovered Impacted Soil and Groundwater at the Four Powerhouses	Active recreation	Residential/leaching to groundwater
9	Undiscovered Impacted Soil and Groundwater at the Four Dam Developments	Active recreation	Residential/leaching to groundwater
17	Undiscovered Impacted Soil and Groundwater Outside the Removal Work Zone	Passive recreation/natural habitat	Residential/ecological/leaching to groundwater

The Investigative Standard includes preparation of a Site Investigation Report to document the investigation and assessments performed, as described in Section 4 of the Oregon SIWP (Jacobs 2021a).

Except as may be otherwise expressly approved in writing by PacifiCorp, KRRC, the State of California, and the State of Oregon, the implementation of any work under this Oregon Supplement and any updates or follow-up will constitute Jacobs' representation to PacifiCorp, KRRC, and the State of Oregon, that such work complies with the Investigative Standard as presented in the Oregon SIWP (Jacobs 2021a).

1.5 Oregon Supplement Organization

This Oregon Supplement is organized into three sections and two appendices. Supporting tables and figures are located in text (Table 1-1) and at the end of text (all others). The sections and appendices are summarized as follows:

- **Section 1 – Introduction**: Describes the Oregon Supplement purpose and objectives, identifies the RECs to be addressed, provides background information on the evolution of the RECs, and touches on investigative standards and future site uses. See Section 1 of the Oregon SIWP (Jacobs 2021a) for complete descriptions of the program organization, program timeline, and investigative standards.
- **Section 2 – Site Evaluation and Investigation**: Describes the evaluation process for addressing the seven remaining RECs not included in the Oregon SIWP.
- **Section 3 – References**: Provides a bibliographic listing of documents cited in this Oregon Supplement.

- **Appendix A – Underground Storage Tank Registration and Decommissioning Documents**: Contains documents associated with the Oregon Department of Environmental Quality (DEQ) UST registration and decommissioning.
- **Appendix B – Consolidated Comment Matrix**: Contains consolidated review comments and responses from the KRRC and Oregon related to this Oregon Supplement.

2. Site Evaluation and Investigation

This section presents the results of the site investigations and evaluations conducted for the seven RECs listed in Section 1. The Sampling and Analysis Plan (Appendix A of the Oregon SIWP) will be followed for each REC.

The High-voltage switchyards and Retained Easement RECs are evaluated because: 1) the substation, switchyard, and easement locations are known; 2) they are accessible to some degree; and 3) their environmental conditions can be reasonably evaluated in the near-term. The USTs REC is evaluated should an unknown UST be discovered during dam decommissioning or demolition. Because evaluation of undiscovered RECs is not possible at this time, this Oregon Supplement presents a process to be implemented should impacted soil or groundwater be encountered in the subject areas during dam decommissioning and demolition.

2.1 High-voltage Switchyards (REC 8)

High-voltage switchyards and substations (collectively called switchyards here for ease of use) are connected directly to PacifiCorp's electrical generation, transmission, and distribution systems. Switchyards are integral for distributing power and maintaining stability of the local electrical grid. An abundance of high-voltage elements makes work within switchyards restricted without specialized planning. However, following further review and discussions with PacifiCorp substation operations, environmental sampling within the energized switchyards is considered possible with appropriate safety measures. Consequently, this Oregon Supplement identifies the means and methods by which the J.C. Boyle switchyard will be assessed.

2.1.1 Findings from Previous Investigations

The J.C. Boyle Development has one approximate 150- by 150-foot switchyard that was noted by AECOM (2018, 2020) to contain "electrical transformers, substations, transmission poles, and lines within a fenced gravel area. The majority of the transmission pole footings, substations, and transformers are on top of cement pads. It was noted that the 'yellow glass portion' of the high-voltage transformer bushings may potentially contain Polychlorinated Biphenyl (PCBs) in the oil." There is a potential for PCBs to be present within the switchyard because the J.C. Boyle Development and original supporting structures were completed in 1958 (AECOM 2020) and because use of PCBs was not banned under the Toxic Substances Control Act until 1979.

2.1.2 Sampling Plan

Of note is that there are no records of spills or releases at the switchyards. The environmental sampling activities are being performed to confirm the presence or absence of PCBs within the switchyard. If analytical results from the initial sampling event indicate the presence of PCBs, then additional sampling at the switchyard may be performed within identified areas of concern as per 40 *Code of Federal Regulations* Part 761, Subpart N. Concrete sampling will additionally be performed for PCBs at the switchyard, and the analytical results will be used to help determine disposal options for concrete.

Prior to collecting soil samples, field staff will use Global Positioning System software to lay out a 25- by 25-foot sampling grid (Figure 2-1). Field staff will note facility structures, topography, and drainage in the area and will adjust the planned sample locations as necessary. The planned sample locations will be marked for approval by the PacifiCorp substation operations group and for utility clearance prior to sampling.

The COPCs for the switchyard and substation are PCBs and transformer oil. Consequently, soil samples will be analyzed for PCBs by U.S. Environmental Protection Agency (EPA) Method SW846 8082A and for oil and grease by EPA Method 1664. Should PCBs be detected in soil samples, EPA Method 1668 (PCB homologue method) with EPA Extraction Method SW846 3540C may be performed on select soil samples. If groundwater is encountered when collecting soil samples at the switchyards, unfiltered grab groundwater samples will be collected for submittal to the analytical laboratory. Surface gravel will be removed to allow sampling of fine-grained native soil or fine import material. Soil samples from a depth of 0.5 to 1.0 foot below native surface grade will be collected (Table 2-1, Oregon SIWP Appendix A [Jacobs 2021a]). The soil samples will be advanced via hand auger. Soil borings will be extended if visual observations indicate that transformer oil has migrated deeper than near surface grade.

Because the J.C. Boyle switchyard is located in a relatively flat area immediately adjacent to the Klamath River in an otherwise steep, access-limited canyon (Figures 1-2 and 2-1), the most likely future use for the switchyard is active recreation (Table 1-1). Such a use will set the applicable soil and groundwater screening levels as described in Oregon SIWP Section 1.5 and developed in Oregon SIWP Section 3.3 (Jacobs 2021a). The validated analytical data will be evaluated against the applicable screening levels, and a site assessment report will be prepared in accordance with Section 4 of the Oregon SIWP (Jacobs 2021a).

Data collection for the switchyard is anticipated to occur in the spring of 2023.

2.2 Retained Easement Areas (REC 6)

2.2.1 Description

Retained easement areas have been identified in Exhibit C as a PEC and are further described in that exhibit as “Any conditions in retained easement areas relating to the presence or operations of retained transmission facilities.” Per the Agreement, PacifiCorp-owned property in Oregon will be conveyed to the KRRC and eventually the State of Oregon. As this process occurs, PacifiCorp will retain easements for the existing transmission and distribution system. Existing easements on privately- or federally-owned property are not included in this REC. Therefore, retained easements, for the purpose of this Oregon Supplement, are defined as the right-of-way on PacifiCorp-owned property in Oregon containing PacifiCorp electrical transmission and distribution system and all other ancillary infrastructure and related access roads. The retained easements are used for accessing, maintaining, operating, repairing, replacing, enlarging, reconstructing, or removing PacifiCorp’s electrical transmission and distribution facilities.

Also included are related electrical transmission facilities such as towers, poles, pads, anchors, supports, transformers, switchyards, vaults, substations, communications facilities, fiber optic or other communications equipment, and any other improvements or facilities associated with the management of these facilities. The retained easement area is the current physical location of the transmission facilities along with an additional area of 100 feet, as measured on the surface of the property and from each side of the transmission or distribution facility.

Aside from incidental observations relating to power poles near J.C. Boyle Dam, retained easements were not assessed under the Phase 1 ESAs that were performed for the J.C. Boyle Development (AECOM 2018; AECOM 2020), and because the retained easement was not assessed, there is potential for PECs to be present within the easement.

There are approximately 10,200 linear feet of retained easements (approximately 52 acres) over four parcels (Figure 2-2).

2.2.2 Assessment Process

The assessment process for the retained easement areas is as follows:

- Perform a review of reasonably obtainable historical documents for the retained easement areas including aerial photographs, historical topographic maps, or other available property records.
- Perform a site reconnaissance survey. Qualified staff will walk accessible parts of the retained easement areas.
- Based on the evaluation and findings of the document review and site reconnaissance by a qualified environmental professional, potential new PECs may be identified. For newly identified PECs within the retained easements, determine the potential COPCs for the PEC(s), perform a site assessment(s) according to the Oregon SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1.
- Document findings in a Site Investigation Report for PEC closure in accordance with Section 4 of the Oregon SIWP (Jacobs 2021a). If new PECs are not identified, the Site Investigation Report will contain a recommendation for REC closure per the terms of the Agreement and the process developed with the KRRC and the State of Oregon.

2.3 Inaccessible Areas (REC 15)

Agreement Exhibit C contains a REC for Inaccessible Areas, without further elaboration adequate to allow investigation. The draft Phase I ESA for the J.C. Boyle Development and other California dam developments contained aerial photographs with points of interest, which at the time, were inaccessible for field reconnaissance due to either locked gates or unsafe road conditions (AECOM 2020). In response to inquiries from PacifiCorp, in April 2022, the KRRC provided further definition of the inaccessible areas (AECOM, pers. comm. 2022). The supplemental information included identification of ten specific locations, none of which are in Oregon. Because there are no inaccessible areas in Oregon identified as part of this REC, PacifiCorp is recommending that this REC be closed per the terms of the Agreement and the process developed with the KRRC and the State of Oregon.

2.4 Underground Storage Tanks (REC 16)

2.4.1 Description

Seven USTs were identified during a Phase I ESA for the Iron Gate Fish Hatchery and the J.C. Boyle, Copco No. 1, Copco No. 2, and Iron Gate developments (AECOM 2018). One of the seven USTs was identified to be associated with the J.C. Boyle Powerhouse. However, the Environmental Database Report for the J.C. Boyle Powerhouse contained no additional information regarding the UST and its location. Because no additional information regarding the UST and its location could be identified, the UST is not mappable and is consequently considered to be an unregistered, "orphan site" (AECOM 2018). No USTs were identified in the area around the J.C. Boyle Powerhouse during ground-penetrating radar surveys conducted by the KRRC, as described in *Draft Buried Structures Site Investigation* (KPC 2020).

2.4.2 Assessment Process

Because no specific USTs have been identified and investigated for this Oregon Supplement, the following assessment process will be observed if the KRRC identifies a UST or suspected UST when removing the J.C. Boyle Development:

- The KRRC will immediately notify PacifiCorp of the discovery. PacifiCorp will: 1) confirm that the UST is located within the Lower Klamath Project FERC boundary; 2) oversee partial exposure of the UST to determine its approximate size; and 3) determine the approximate volume of any residual contents.
- PacifiCorp will determine the potential COPCs for the UST, perform a site assessment according to the Oregon SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1.
- PacifiCorp will coordinate UST removal actions with the Oregon DEQ UST Program. PacifiCorp will additionally initiate and follow the UST registration and decommissioning process outlined in Appendix B.
- General UST removal activities by a licensed contractor will include: 1) full exposure of the UST and preparation of the UST for removal; 2) removal and containment of residual UST contents; 3) cleaning of the UST and containment of decontamination water; 4) upon confirmation by a Certified Industrial Hygienist that the UST is inert, removal of the UST; and 5) offsite disposal of the cleaned UST.
- Upon removal of the UST PacifiCorp will collect soil confirmation samples from the excavation floor and sidewalls and, if required, from expanded excavation floor and sidewalls.
- PacifiCorp will analyze confirmation samples for COPCs related to the former UST contents, and the analytical results from confirmation sampling will be compared against screening levels as described in Oregon SIWP Section 1.5 and developed in Oregon SIWP Section 3.3 (Jacobs 2021a).
- When excavating the UST and if expanding the excavation to obtain additional confirmation soil samples, PacifiCorp will segregate identified impacted soil from unimpacted soil; stockpile all excavated soil on plastic sheeting; and inspect and manage stockpiled soil per regulatory requirements.
- PacifiCorp will properly transport and dispose stockpiled soil and decontamination wastes.
- Upon completion of excavation and confirmation sampling, and if the KRRC requests, PacifiCorp will have the excavation backfilled and compacted with an approved fill material.
- Upon completion of UST excavation, removal, disposal, and confirmation sampling, PacifiCorp will prepare a removal report to document UST removal activities and formally request UST case closure from the Oregon DEQ.
- PacifiCorp recognizes that if a UST is found, it is likely to be in one of the KRRC's active construction areas. Because discovery of a UST has the potential to disrupt the dam removal or restoration timelines, PacifiCorp will actively coordinate with the KRRC and its contractors throughout the investigation and removal process to minimize any disruption to the dam removal process.

2.5 Undiscovered Impacted Soil and Groundwater (RECs 5, 9, and 17)

2.5.1 Description

Three RECs are collectively identified as undiscovered and have the potential to contain impacted soil and groundwater. These RECs are divided into three areas: (1) the powerhouses (REC 5); (2) the dam developments (REC 9); and (3) areas outside the removal work zone (REC 17). Portions of these areas may never be fully evaluated because they are inaccessible or cannot be accessed (for example, soil or groundwater beneath the powerhouse foundation left in place by the KRRC). Because these RECs all address the same potential issue, but at different locations, they are consolidated into a single discussion in this Oregon Supplement.

The objective for these RECs presented in this Oregon Supplement is to establish a process whereby impacted soil and groundwater within the RECs can be addressed if such impacts are encountered. With the standardized approach described in the next section, PacifiCorp will be able to minimize delays related to characterizing and remediating a PEC so that REC closure can be obtained in a timely manner. The approach will be employed if potential contamination associated with these three RECs is identified during dam removal.

If impacted soil or groundwater is encountered within these areas, PacifiCorp will establish whether the impacted soil and groundwater is localized or representative of a contaminant plume. PacifiCorp will then determine if there is a complete migration pathway for the contaminant to a surface water; dilution factors will additionally be assessed on a case-by-case basis if potential contamination is identified. Upon completion of a site investigation, analysis and evaluation of samples, and a risk assessment, PacifiCorp will determine if there is a requirement to implement some type of clean-up, containment, or monitoring program for the REC.

2.5.2 Assessment Process

This section establishes an assessment process whereby PacifiCorp will address impacted soil and groundwater if encountered by the KRRC when decommissioning and demolishing structures at these locations. The reasons for establishing such a process are to help ensure that:

- There is a standardized approach acceptable to the KRRC and the State of Oregon.
- With a standardized approach in place, assessment or remediation of impacted soil and groundwater can be initiated in an expeditious manner to minimize delays associated with dam removal.
- With a standardized approach in place, PacifiCorp can minimize schedule delays and satisfactorily complete required investigative or remedial actions to obtain closure should any PECs come to light.

The stepwise approach will be formalized in a contingency plan to be developed by KRRC and PacifiCorp in advance of construction. The stepwise approach will be used when managing the undiscovered PECs, as follows:

1) Identification of Potential Contamination

The KRRC will have qualified environmental staff onsite during dam removal activities. Such staff will be qualified to collect environmental samples and perform site-specific assessments. Such staff will also be responsible for observing general site conditions and documenting if groundwater appears to be impacted or if soil has a chemical odor, is stained, or has elevated photoionization detector readings greater than 50 parts per million by volume. Should such conditions arise, such staff will report the observations and provide relevant data to PacifiCorp in writing. PacifiCorp will, in turn, mobilize a qualified team-member to further evaluate site conditions.

2) Sampling and Evaluation of Analytical Results against Established Screening Levels

Upon notification by the KRRC of impacted soil or groundwater and a PEC, PacifiCorp will enlist an environmental professional who will additionally evaluate the potential impacts.

Soil and groundwater samples will be collected as appropriate and in accordance with the Oregon SIWP and Appendix A of the Oregon SIWP (Jacobs 2021a). Field sampling and PEC evaluation will be coordinated with the KRRC with respect to ongoing dam removal activities to ensure that any impacts to ongoing dam removal work are minimized.

Upon receipt of the validated analytical results from sampling, the analytical results will be compared against the established screening levels for the determined future use, and recommendations will be made for PEC closure or further assessment, remediation, risk assessment, or a combination.

3) Remediation and Removal of Impacted Media

PacifiCorp recognizes that assessment and evaluation of impacted soil or groundwater may delay ongoing dam removal work at some locations. Because of this potential for delay, at PacifiCorp's discretion and in coordination with the KRRC, PacifiCorp may proceed directly to site remediation to minimize impacts on dam removal activities and progress.

Removal action in advance of testing means that PacifiCorp would manage impacted materials as outlined in the contingency plan. Potentially impacted soil or groundwater will be excavated and hauled to an approved waste staging area identified by the KRRC and as outlined in the contingency plan. Impacted soil will be segregated from unimpacted soil, and water will be properly containerized within secondary containment. Soil stockpiles will be placed on and covered with plastic sheeting, and stockpiles and containerized wastes will be inspected weekly and actively managed by PacifiCorp. Upon evaluation of the analytical results for the soil stockpiles, PacifiCorp will identify which stockpiles can be reused or disposed onsite by the KRRC and which soil stockpiles will be disposed of offsite by PacifiCorp. Containerized water will be disposed of offsite by PacifiCorp or may be reused onsite for dust suppression by the KRRC depending on the analytical results.

As part of a removal action, PacifiCorp will collect confirmation samples from excavation floors and sidewalls and will also collect soil samples from the floor and sidewalls of an expanded excavation should that be required. The confirmation samples will be analyzed for COPCs and will be evaluated against the screening levels as described in Oregon SIWP Section 1.5 and developed in Oregon SIWP Section 3.3 (Jacobs 2021a). Upon evaluation of the analytical results from confirmation sampling, PacifiCorp will identify if the removal action is incomplete and additional excavation is required or if the removal action is complete and the excavation can be backfilled and compacted (if necessary).

4) Site Investigation Report and PEC Closure

Upon completion of site assessment or remedial activities, PacifiCorp will prepare a Site Investigation Report for PEC closure in accordance with Section 4 of the Oregon SIWP (Jacobs 2021a). The PEC will also be recommended for closure by PacifiCorp per the terms of the Agreement and the process developed with the KRRC and the State of Oregon. If impacted soil and groundwater are not observed at completion of facilities removal for RECs 5 and 9 (dams and powerhouses) and at the completion of restoration for REC 17, then the RECs will be recommended for closure by PacifiCorp per the terms of the Agreement and the process developed with the KRRC and the State of Oregon.

Underground Storage Tank Registration and Decommissioning Documents

State of Oregon
Department of
Environmental
Quality

OREGON DEPARTMENT OF ENVIRONMENTAL QUALITY
UNDERGROUND STORAGE TANK PROGRAM

GENERAL PERMIT REGISTRATION FORM TO DECOMMISSION EXISTING UNREGISTERED TANKS

and

30-DAY NOTICE OF INTENT TO DECOMMISSION USTS

- This form for registration of existing tanks that have never been reported to DEQ should be submitted at least 30-days before beginning decommissioning by permanent closure.
- To register existing tanks you must submit pages 4 through 8 of this registration form and a check for the amount of the required registration fee. See page 4 to calculate the required fee.
- If you are registering more than five (5) tanks, please make a copy of pages 7 and 8. List the additional tanks on the copy.
- You must call your regional office to receive authorization to proceed with the decommissioning at least 72 hours prior to beginning work. See page 3 for phone numbers.
- You must submit the Underground Storage Tank Decommissioning Checklist and Site Assessment Report to your local Regional Office within 30 days following completion of the tank decommissioning or change-in-service **regardless if cleanup work is ongoing.**

CHECKLIST

1. Be sure signatures are provided for the tank owner, permittee and property owner, **even where one person fills all three roles**.
2. Complete the registration form for all tanks being registered at the facility.
3. Make copies for your records.
4. Enclose your check payable to:
   Oregon Department of Environmental Quality
5. Please return the general permit registration form and applicable registration fee to:

   Department of Environmental Quality
   Attn: Revenue Section
   700 NE Multnamah St.
   Portland, Oregon 97232

INSTRUCTION PAGE

DESCRIPTION OF GENERAL PERMIT PROGRAM

In lieu of issuing individual permits, Oregon's UST permitting program has adopted a general permit by rule to decommission USTs that identifies the conditions and requirements for temporary and permanent closure or completing a change-in-service. By signing the registration forms, you are certifying that you will comply with all the conditions and requirements of the general permit to decommission USTs.

DEFINITIONS

Facility – the place where the tank is located.

Decommission – means temporary or permanent closure, including temporary or permanent removal from operation, filling in-place, removal from the ground or change-in-service to non-regulated status.

Owner – means a person who currently owns an UST or owned an UST during the tanks operational life. If registered with the Secretary of State, Corporations Division, the UST owner is the legal business name.

Permittee – means the owner or person designated by the owner, who is in control or has responsibility for daily UST system operation and maintenance, financial responsibility and UST operator training requirements under a general permit pursuant to OAR 340-150-0160 through 340-150-0168. If registered with the Secretary of State, Corporations Division, the permittee is the legal business name. The permittee is mailed the annual compliance fee invoice.

Property owner – means the legal owner of the real property on which an UST is located (the name that appears on the County deed records).

GENERAL PERMIT REGISTRATION FORM

1. Please fill in the name, address and phone number of the facility. If this facility is registered with DEQ please include the DEQ facility number.
2. Please fill in the number of tanks in the space provided in the general permit registration fee section. For existing tanks not previously registered, back fees are required by OAR 340-150-0110 (6). Calculate the total amount due.
3. Please fill in the tank owner's legal name, address and phone number. The legal name is the name of the tank owner as filed with the Secretary of State, Corporations Division, if applicable. The tank owner must sign the registration form.
4. The tank owner can designate a permittee for each facility. Please ask the permittee in charge of the facility to fill in their legal name, address and phone number. The legal name is the name of the permittee as filed with the Secretary of State, Corporations Division, if applicable. The permittee must sign the registration form.
5. Please fill in the property owner's name, address and phone number. The property owner's name should be the name in the county deed records. The property owner must sign the registration form.
6. There must be three signatures for each completed registration form – the tank owner, permittee and property owner. **IF ONE PERSON FILLS ALL THREE ROLES, THAT PERSON MUST SIGN THREE TIMES.**
7. Complete all sections and pages of the form.

LICENSED SERVICE PROVIDERS AND SUPERVISORS

ORS 466.750 and OAR 340 – Division 160 requires that licensed service providers perform tank decommission work. If contaminated soil is discovered during decommissioning, and a decision is made to remediate the site using the soil matrix rules, ORS 466.750 and OAR 340 – Division 162 requires that licensed service providers perform soil matrix cleanup work. During certain critical phases as specified in the rules, a licensed supervisor must be present on site to monitor the work. A list of licensed service providers and supervisors is available upon request by calling (503) 229-6652 or toll-free in Oregon 1-800-742-7878 (a message answering machine). **NOTE: AN OWNER OR PERMITTEE MAY PERFORM UST SERVICES ONLY IF THEY HAVE TAKEN AND PASSED THE APPROPRIATE UST SUPERVISOR EXAMINATION OFFERED BY A NATIONAL TESTING SERVICE (OAR 340-150-0156)**.

INSTRUCTION PAGE

HELP WITH THIS REGISTRATION FORM

If you have any questions about this registration form, please phone the DEQ UST Program at (503) 229-6652. You can also phone the UST Program's toll-free Oregon number, 1-800-742-7878. This is a message answering machine for calls made in Oregon. Underground Storage Tank Program staff will return your call within 24 hours (one business day). You can also send an e-mail to tanks.info@deq.state.or.us. Our regional staff is also available to answer questions regarding the general permit program and this general permit registration form (see below for telephone numbers).

COPIES OF GENERAL PERMIT CONDITIONS AND REQUIREMENTS AND UST PROGRAM RULES

Copies of the general permit to decommission conditions and requirements and UST Program rules and laws can be obtained from:

1. Any of the DEQ offices listed below,
2. By calling the UST HELPLINE at 1-800-742-7878,
3. Send an e-mail to tanks.info@deq.state.or.us, or
4. Downloading from the UST home page at:

http://www.deq.state.or.us/lq/tanks/ust/index.htm

View Oregon Administrative Rules (OAR) and open Division 150 to OAR 34-150-0166 & 340-150-0168.

GENERAL PERMIT REGISTRATION FORM

TO DECOMMISSION UNREGISTERED USTs

1. TANK OWNER* as registered with the Secretary of State, Corporations Division

Name of Official (***Please Print***)

Signature of Official Date

Mailing Address (***Please Print***)

City, State and Zip Code

Area Code and Telephone Number

I will decommission the USTs described on the *Notification and Description of Underground Storage Tank Systems* pages in accordance with the conditions and requirements of the general permit to decommission.

2. PERMITTEE* as registered with the Secretary of State, Corporations Division

Name of Official (***Please Print***)

Signature of Official Date

Mailing Address (***Please Print***)

City, State and Zip Code

Area Code and Telephone Number

I will decommission the USTs described on the *Notification and Description of Underground Storage Tank Systems* pages in accordance with the conditions and requirements of the general permit to decommission.

3. PROPERTY OWNER is name that appears on the County deed record for this property.

Name of Official (***Please Print***)

Signature of Official Date

Portland, OR 97232

Notification and Description of Underground Storage Tank Systems

TYPE OF OWNER

- ☐ Federal Government
- ☐ State Government
- ☐ Local Government
- ☐ Commercial
- ☐ Private

INDIAN COUNTRY

- ☐ Tanks are located on land within an Indian Reservation or on trust lands outside reservation boundaries.
- ☐ Tanks are owned by a Native American nation or tribe.

Tribe or Nation:

TYPE OF FACILITY

- ☐ Gas Station
- ☐ Petroleum Distributor
- ☐ Air Taxi (Airline)
- ☐ Aircraft Owner
- ☐ Auto Dealership
- ☐ Railroad
- ☐ Federal - Non-Military
- ☐ Federal - Military
- ☐ Industrial
- ☐ Contractor
- ☐ Trucking/Transport
- ☐ Utilities
- ☐ Residential
- ☐ Farm
- ☐ Other (Explain)

FINANCIAL RESPONSIBILITY

☐ I will meet the financial responsibility requirements in accordance with OAR 340 – Division 151

Check All that Apply

- ☐ Pollution Liability Insurance
- ☐ Self Insurance
- ☐ Exempt (Federal or State Government
- ☐ Letter of Credit
- ☐ Surety Bond
- ☐ Guarantee
- ☐ Local Government

The financial responsibility requirements are designed to make sure that the tank owner, property owner or permittee can pay the costs of cleaning up leaks and compensating third parties for bodily injury and property damage caused by leaking USTs. A plain language summary of the financial responsibility requirements can be downloaded from the Internet at http://www.epa.gov/swerust1/pubs/dollars.htm. For a list of known insurance providers go to http://www.epa.gov/swerust1/pubs/inslist.htm.

Consolidated Comment Matrix

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
California Department of Water Resources / California Department of Fish and Wildlife - Office of Spill Prevention and Response (Comments on the California Site Investigation Work Plan Supplement)					
CA-General	KT	General		CDFW-OSPR would like to conduct a site visit during the fieldwork, which PacifiCorp/Jacobs indicates will occur in the fall and winter of 2022-23. CDFW-OSPR requests PacifiCorp/Jacobs provide a schedule for fieldwork to be conducted, which will allow CDFW-OSPR to determine appropriate dates for a site visit to observe fieldwork activities and assess the effectiveness of avoidance and minimization measures that have been implemented.	If CDFW-OSPR staff are available when the PacifiCorp team is conducting this work, a site visit can be arranged. The implementation schedule has not been set, but once it is there will be limited flexibility.
CA-1	KT	High-Voltage Switchyards (REC 8)	Section 2.1, page 2-1	High Voltage Switchyards (REC 8). CDFW would like additional documentation of PacifiCorp's obligation to assess conditions prior to extinguishing the easement or otherwise terminating the use. Perhaps include text in the REC closure form and include text in the retained easement.	In the Property Transfer Agreement (Agreement) Section 3.5(a) requires that PacifiCorp resolve all pre-existing environmental conditions at its sole cost and expense to the reasonable satisfaction of the KRRC in consultation with the respective State. The sites PacifiCorp will not be able to address at closing will all have to be in the Post-Closing Environmental Resolution Agreement as a Retained Environmental Obligation (per Agreement Exhibit F). Section 2.2 of the Post-Closing Environmental Resolution Agreement repeats Agreement Section 3.5(a). Additionally, Agreement Exhibit H-1, Section B.1 states that "*Grantor shall, at its sole cost and expense, maintain the Substation Easement Areas and the Retained Substation Facilities in an orderly and safe condition and comply with all laws, including all regulatory, environmental, and safety requirements, applicable to Grantor and its activities under the Substation Easement including the use and management of the Retained Substation Facilities and the Substation Easement Areas.*" PacifiCorp interprets this as requiring PacifiCorp to do the necessary investigation and clean-up if an easement is released. No edits to Supplement No. 1 are necessary.
CA-2	KT		Section 2.1.2 Sampling Plan and Table 2-1, Page 2-2	The Supplement #1 states: "The COPCs for the switchyards are PCBs and transformer oil." Filtering is not considered appropriate for water samples to be analyzed for PCBs because contaminants that sorb to particulates are removed when filtered. We recommend that PacifiCorp/Jacobs perform a risk assessment using unfiltered data.	Section 2.1.2 of Supplement No. 1 has been modified to state the following: "If groundwater is encountered when collecting soil samples at the switchyards, unfiltered grab groundwater samples will be collected for submittal to the analytical laboratory." The groundwater samples will be analyzed for the same COPCs as the soil samples.
CA-3	KT		Section 2.1.2 Sampling Plan, Page 2-2	The Supplement #1 states: "Consequently, soil samples will be analyzed for PCBs by U.S. Environmental Protection Agency (EPA) Method SW846 8082A…" CDFW-OSPR strongly recommends that homologue analysis be used to estimate total PCBs concentrations in soil and groundwater samples. It is unclear if Aroclor-based methods or PCB congener-specific and PCB homologue methods will be used in analytical testing services for samples. The analytical method described in Valoppi et al. (2000) should be used for assessing risk of the 28 PCB congeners that exhibit dioxin-like toxicity.	The methods in Supplement No. 1 reflect current guidance from EPA and DTSC. Specifically, as recommended by DTSC in HERO guidance, *Human Health Risk Assessment Note Number 8: Recommendations for Evaluating Polychlorinated Biphenyls (PCBs) at Contaminated Sites in California* (DTSC/HERO 2020) and the *PCB Evaluation Quick Reference Guide* (DTSC 2023), soil samples will be analyzed for PCBs per EPA Method SW846 8082A. The PCB Evaluation Quick Reference Guide specifically states, "DTSC and U.S. EPA require Method 8082 for PCB analysis, and recommend Method 1668 or 680 on select samples to provide a detailed specification of PCBs in certain situations." Section 2.1.2 of Supplement No. 1 has been modified to state the following: "Should PCBs be detected in soil samples, EPA Method 1668 (PCB homologue method) with EPA Extraction Method SW846 3540C may be performed on select soil samples." This edit has also been made to OR Supplement No. 1.

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
CA-4	KT		Section 2.4.2 Assessment Process, Page 2-4	Please verify the assessment process can be accomplished without interfering with dam removal. For example, some of the bulleted actions could affect schedule (e.g. acquiring a removal permit from the CUPA [Certified Unified Program Agency]) and we're wondering if dam removal activities can proceed while the assessment process is implemented.	Whether dam removal activities could proceed should an undocumented UST (or other issue) be discovered will depend on the location and size of the UST and how quickly the CUPA would respond with issuance of a UST Removal Permit, approval of the UST Removal Work Plan, and concurrence with planned removal schedule. PacifiCorp presumes that the UST would minimally be cordoned with temporary fencing, etc., and that dam removal activities would resume while permitting and the approvals process for UST removal proceeds. Per discussion with the CUPA on October 5, 2022, the turnaround time for UST removal upon discovery and under purview by the CUPA is approximately 1 week from submittal of a proper UST removal permit application with proper UST removal work plan. No edits to Supplement No. 1 are necessary.
CA-5	KT		Section 2.5 Undiscovered Impacted Soil and Groundwater (RECs 5, 9, and 17), Page 2-4	The Supplement #1 indicates: "*The objective for the RECs presented in this California Supplement is to establish a process whereby impacted soil and groundwater within the RECs can be addressed if such impacts are encountered.*" CDFW-OSPR requires PacifiCorp/Jacobs ensure contaminants which may enter State waters are not at levels deleterious to fish, mammals, plant life or bird life (Fish and Game Code section 5650). The California Fish and Game Code identifies "*Fish*" as "*a wild fish, mollusk, crustacean, invertebrate, amphibian, or part, spawn, or ovum of any of these animals.*" CDFW-OSPR suggests that the PacifiCorp/Jacobs continue to monitor contaminant concentrations in surface water if PacifiCorp/Jacobs detects concentrations over the project action limit in ground water.	PacifiCorp is currently not required to monitor contaminant concentrations in surface water within the dam developments as they exist now. Before performing such monitoring, impacted soil or groundwater would first have to be encountered within features associated with REC 5, 9, or 17. Section 2.5.1 of Supplement No. 1 has been modified to read as follows: "If impacted soil or groundwater is encountered within these areas, PacifiCorp will establish whether the impacted soil and groundwater is localized or representative of a contaminant plume. PacifiCorp will then determine if there is a complete migration pathway for the contaminant to a surface water; dilution factors will additionally be assessed on a case-by-case basis if potential contamination is identified. Upon completion of a site investigation, evaluation of analytical results, and a risk assessment, PacifiCorp will determine if there is a requirement to implement some type of clean-up, containment, or monitoring program for the REC." This same edit has been made to OR Supplement No. 1.
CA-6	KT		Section 2.5 Undiscovered Impacted Soil and Groundwater (RECs 5, 9, and 17), Page 2-4	Once potential contamination is identified, please provide dilution factors for transport between groundwater and surface water. If sufficient validation is not available for a specific dilution factor, please make the conservative assumption that there is no dilution of contaminants between ground and surface waters.	Please see the response to CA-5.
CA-7	KT		Section 2.5.2 Assessment Process, Page 2-5	Same comment as #4 [CA-4] above. CDFW notes that PacifiCorp acknowledge in the Supplement that assessment and evaluation of impacted soil or groundwater may delay ongoing dam removal work at some locations. Is there other contingency planning that could occur with KRRC?	PacifiCorp is fully aware of the potential implications from any discovered issues to affect the overall project schedule. Item 3 on page 2-5 indicates that PacifiCorp may proceed directly to clean-up of a suspect location, stockpile the material, and then do the assessment and evaluation necessary to determine the scope of the issue, if any. Rapid removal in close coordination with the KRRC team is the best way to minimize potential effects on the dam removal work schedule. PacifiCorp has confirmed that the KRRC will have a plan to address this issue should it occur (Morton D. McMillen, McMillen Jacobs Associates, to Demian Ebert, PacifiCorp, on October 31, 2022, at 6:19 AM). Section 2.5.2 of Supplement No. 1 has been modified to read as follows: "The stepwise approach will be formalized in a contingency plan to be developed by KRRC and PacifiCorp in advance of construction. The stepwise approach will be used when managing the undiscovered PECs, as follows:..."

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
CA-8	KT		Section 2.5.2 (1) Identification of Potential Contamination, Page 2-5	Please confirm PacifiCorp's assumption is correct that KRRC will have environmental staff onsite that can identify hazardous materials.	McMillan Jacobs Associates is the KRRC's representative for removal. McMillan Jacobs Associates confirmed that they will have environmental staff onsite during all removal work and a contractual relationship with a firm qualified to collect samples and do a site-specific assessment (Morton D. McMillen, McMillen Jacobs Associates, to Demian Ebert, PacifiCorp, on October 31, 2022, at 6:19 AM). Section 2.5.2 (1) of Supplement No. 1 has been modified to read as follows: "The KRRC will have qualified environmental staff onsite during dam removal activities. Such staff will be qualified to collect environmental samples and perform site-specific assessments."
CA-9	KT		Section 2.5.2 (3) Remediation and Removal of Impacted Media, Page 2-5	Please confirm that KRRC has identified an approved waste staging area. If possible, please also confirm that the waste staging area can accommodate the potential materials that could be discovered. Please also determine if RES intends to use a certain amount of soil for restoration such that any contaminated soil that can't be reused would impact restoration plans. We're wondering what sort of adjustments, if any, RES (or the team) would need to make if all the soil can't be reused onsite.	Because these particular RECs are currently unknown and unknowable, clean-up actions cannot be developed, and selection of specific stockpile locations or potential uses of excess material have not been developed. However, PacifiCorp expects that development of a detailed contingency plan (see response to CA-7) will be developed before the start of construction. That plan would be coordinated with the KRRC's team to identify waste staging areas, stockpile management, soil reuse, backfill and compaction, and offsite disposal requirements all with an eye toward reducing potential conflicts and schedule impacts on the dam removal project. Section 2.5.2 (3) of Supplement No. 1 has been modified to read as follows: "Removal action in advance of testing means that PacifiCorp would manage impacted materials as outlined in the contingency plan. Potentially impacted soil or groundwater will be excavated and hauled to an approved waste staging area identified by the KRRC and as outlined in the contingency plan." The corresponding edit has been made to OR Supplement No. 1.
CA-10	KT		Section 2.5.2 (4) Site Investigation Report and PEC Closure, Page 2-6	CDFW requests that RECs not be closed by default. Instead, PacifiCorp should acquire CDFW's and KRRC's concurrence prior to closing the REC.	Section 2.5.2 (4) of Supplement No. 1 has been modified to read as follows: "If impacted soil and groundwater are not observed at completion of facilities removal for RECs 5 and 9 (dams and powerhouses) and at the completion of restoration for REC 17, then the RECs will be recommended for closure by PacifiCorp per the terms of the Agreement and the process developed with the KRRC and the State of California."

* KT = Kevin Takei

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
Klamath River Renewal Corporation (Comments on the California and Oregon Site Investigation Work Plan Supplements)					
KRRC-General	LL			I should add, as a general matter, that KRRC incorporates the States' comments.	Acknowledged.
KRRC-1	LL	CA Supplement	Section 1.2, last paragraph	Please rephrase as "The RECs identified in this California Supplement will be assessed by following the same processes, procedures, and standards provided for in the California SIWP."	The KRRC and State of California approvals of the California SIWP are recommended in the document in order to establish precedence for use of the same processes, procedures, and standards when assessing the RECs identified in the California Supplement. The last sentence of the first paragraph in Section 1.1 in Supplement No. 1 now reads as follows: "This California Supplement incorporates the California SIWP by reference and provides specific information necessary to address remaining RECs in accordance with the California SIWP, which was approved by the KRRC (Lowy, pers. comm. 2021) and the State of California and which was implemented when assessing the various RECs within the Copco No. 1, Copco No. 2, and Iron Gate developments (Jacobs 2021a)." The last paragraph of Section 1.2 in Supplement No. 1 now reads as follows: "The RECs identified in this California Supplement will be assessed by following the same processes, procedures, and standards that were approved for the California SIWP."
KRRC-2	LL	CA Supplement	Section 1.4	""Notwithstanding any specific process or procedure identified in this California Supplement, …"	This text has been incorporated into the document.
KRRC-3	LL	CA Supplement	Section 1.4, Table 1-1	What was the basis for determining the future uses of the different areas? For example, I question whether it's correct to refer to the future uses of all of the retained easements as industrial – certainly some areas are but outside of the exclusive easement areas I'm not sure that's the case.	The future uses listed in Table 1-1 were confirmed by the State of California on November 7, 2022 (Kevin Takei, State of California, to Demian Ebert, PacifiCorp, November 8, 2022, at 12:10 p.m.) and have been incorporated into Supplement No. 1.
KRRC-4	LL	CA Supplement	Section 2.1	Please state the methodology for quantity of samples and grid spacing etc. KRRC suggests the EPA methodology (40 CFR Part 761, Subpart N) for characterizing the media.	Section 2.1.2 of Supplement No. 1 has been modified to read as follows: "Of note is that there are no records of spills or releases at the switchyards. The environmental sampling activities are being performed to confirm the presence or absence of PCBs within the switchyards. If analytical results from the initial sampling event indicate the presence of PCBs, then additional sampling at the Copco No. 1 or Iron Gate switchyards may be performed within identified areas of concern as per 40 *Code of Federal Regulations* Part 761, Subpart N. Concrete sampling will additionally be performed for PCBs at the switchyards, and the analytical results will be used to help determine disposal options for concrete."
KRRC-5	LL	CA Supplement	Section 2.1, second paragraph	The assertion that the retained easement areas in the high-voltage switchyards will not be assessed at this time is not something that, as far as I know, has been discussed previously with KRRC. I understand the rationale and don't necessarily object but that discussion should take place. If that is, in fact, where we end up, then PacifiCorp's obligation to assess and remediate these easement areas at a much later date will need to be expressly identified in the Post-Closing Environmental Resolution Agreement and the reservation of easements, and carved out of any closure of any other retained easement areas.	Please see the response to CA-1.

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
KRRC-6	LL	CA Supplement	Section 2.1.2, penultimate (second-to-last) paragraph	The likely future use of the switchyard areas should be determined at the relevant time in consultation with California and, if applicable, KRRC rather than being assumed by PacifiCorp.	Please see the response to KRRC-3.
KRRC-7	LL	CA Supplement	Section 2.2.1, second paragraph	I believe this acknowledges that the easement area extends 100 feet on each side of the transmission and distribution facilities – please confirm or rephrase accordingly.	The text of the California Supplement correctly states that the retained easements for the transmission and distribution system is the location of existing structures buffered by 100 feet on either side of the line. No edits to Supplement No. 1 are necessary.
KRRC-8	LL	CA Supplement	Section 2.4.2, second bullet	The likely future use of the areas within UST footprints should not be determined by PacifiCorp but rather by KRRC and California.	Please see the response to KRRC-3.
KRRC-9	LL	CA Supplement	Section 2.5.2, paragraph 1	There should be a discussion regarding the extent to which KRRC will have environmental staff onsite during dam removal and the process should be tailored around that.	Please see the response to CA-8.
KRRC-10	LL	CA Supplement	Section 2.5.2, paragraph 3	I'm not sure what "PacifiCorp's discretion in coordination with KRRC" means in this context; a decision to proceed to remediation without investigation should not be made by PacifiCorp without first consulting KRRC; same for deciding which soil stockpiles are to be reused or disposed of onsite.	The goal of this entire item is to reduce the potential for the overall dam removal project to be delayed by the need to investigate, analyze, and then clean-up a newly discovered potential contamination site. Instead, if contamination is identified as potentially present, PacifiCorp may at its discretion, and in consultation with the KRRC, proceed to clean-up a suspected site simply to expedite the overall removal project. Management of soil would be detailed in a contingency plan (see response to CA-9). Section 2.5.2 (3) of Supplement No. 1 has been modified to read as follows: "Because of this potential for delay, at PacifiCorp's discretion and in coordination with the KRRC, PacifiCorp may proceed directly to site remediation to minimize impacts on dam removal activities and progress."
KRRC-11	LL	OR Supplement	Section 1.2, last paragraph	Please rephrase as "The RECs identified in this Oregon Supplement will be assessed by following the same processes, procedures, and standards provided for in the Oregon SIWP."	The KRRC and State of Oregon approvals of the Oregon SIWP are recommended in the document in order to establish precedence for use of the same processes, procedures, and standards when assessing the RECs identified in the Oregon Supplement. The last sentence of the first paragraph in Section 1.1 of Supplement No. 1 now reads as follows: "This Oregon Supplement incorporates the Oregon SIWP by reference and provides specific information necessary to address remaining RECs in accordance with the Oregon SIWP, which was approved by the KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021) and which was implemented when assessing J.C. Boyle Dispersed Recreation Area - 2 (Jacobs 2021a)." The last paragraph of Section 1.2 in Supplement No. 1 now reads as follows: "The RECs identified in this Oregon Supplement will be assessed by following the same processes, procedures, and standards that were approved for the Oregon SIWP."

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
KRRC-12	LL	OR Supplement	Section 1.4, first paragraph	Please add the following at the beginning of the first sentence: ""Notwithstanding any specific process or procedure identified in this Oregon Supplement, …"	This text has been incorporated into the document.
KRRC-13	LL	OR Supplement	Section 1.4, Table 1-1	What was the basis for determining the future uses of the different areas? For example, I question whether it's correct to refer to the future uses of the retained easements as industrial as there are not any exclusive easement areas in Oregon.	The future uses listed in Table 1-1 were based on the uses for various areas as established in the SIWP. The review process for the draft Final Supplement was intended to ensure that future uses conformed with Oregon's ultimate vision for these locations. Per Oregon's recommendation, the future use for retained easements has been changed to Active Recreation per Oregon's comment (see Comment OR-1).
KRRC-14	LL	OR Supplement	Section 2.1	The Oregon Supplement only indicates sampling of the sub-surface soil. KRRC believes PacifiCorp should also sample the gravel and the concrete, as it will be relocated or disposed of.	Soil beneath gravel would be expected to be impacted by potential PCB or dielectric fluid spills. If PCBs were present in potential spills, the PCBs would have been washed through the gravel and attached to the fines in the soil. The gravel is not expected to contain much fine material and those fine materials are needed to run the analytical tests. The following text has been added to Section 2.1 of Supplement No. 1: "Concrete sampling will additionally be performed for PCBs at the switchyard, and the analytical results will be used to help determine disposal options for concrete."
KRRC-15	LL	OR Supplement	Section 2.2.2, third bullet	Again, future uses of that portion of the property should be determined by consulting KRRC and Oregon.	The future site uses as shown in Table 1-1 have been approved by the KRRC and Oregon. The second sentence of this bullet has been modified to read: "For newly identified PECs within the retained easements, determine the potential COPCs for the PEC(s), perform a site assessment(s) according to the Oregon SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1." The corresponding edit has been made to CA Supplement No. 1.
KRRC-16	LL	OR Supplement	Section 2.4.2, second bullet	Same comment as 2.2.2 [KRRC-15].	The future site uses as shown in Table 1-1 have been approved by the KRRC and Oregon. The text of this bullet has been modified to read: "PacifiCorp will determine the potential COPCs for the UST, perform a site assessment according to the Oregon SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1." The corresponding edit has been made to CA Supplement No. 1.
KRRC-17	LL	OR Supplement	Section 2.5.2, paragraph 1	There should be a discussion regarding the extent to which KRRC will have environmental staff onsite during dam removal and the process should be tailored around that.	Please see the response to CA-8. The corresponding edit has been made to Oregon Supplement No. 1.
KRRC-18	LL	OR Supplement	Section 2.5.2, paragraph 3	A decision to proceed to remediation without investigation should not be made by PacifiCorp without first consulting KRRC; same for deciding which soil stockpiles are to be reused or disposed of onsite	Please see the response to KRRC-10. The corresponding edit has been made to Oregon Supplement No. 1.

Oregon Department of Justice (Comments on the Site Investigation Work Plan Supplements)					
OR-1	CM		General	Oregon joins in the comments by KRRC and the Golden State. Our only specific comment is that we believe the future uses described for the retained easement areas in Oregon are incorrect – the land is not "industrial" as the likely exposure pathway will actually be "active recreation" (as none of the areas are exclusively for use by PacifiCorp – these are transmission line easements). Therefore those areas will need to be remediated (as necessary) to the higher standard.	The future use for the retained easements has been changed to Active Recreation. Also, please see the response to KRRC-13.

PCB	polychlorinated biphenyl
PEC	pre-existing environmental condition
Project	Lower Klamath Hydroelectric Project
REC	recognized environmental condition
California SIWP	California Site Investigation Work Plan
California Supplement	California Site Investigation Work Plan Supplement No. 1
UST	underground storage tank

1. Introduction

As part of the Lower Klamath Hydroelectric Project (FERC No. P-14803), PacifiCorp and the Klamath River Renewal Corporation (KRRC) have entered into a legally-binding Property Transfer Agreement (Agreement) that identifies 17 pre-existing environmental conditions (PECs) located in the states of California and Oregon. All of the PECs are identified in Exhibit C of the Agreement.

While the Agreement and specifically Exhibit C discuss the resolution of PECs, the *California Site Investigation Work Plan* (California SIWP) (Jacobs 2021a) and this *California Site Investigation Work Plan Supplement No. 1* (California Supplement) refer to the Exhibit C items generically as recognized environmental conditions (RECs). Not all PECs in Exhibit C have been formally identified as a REC in a Phase I environmental site assessment (ESA).

PacifiCorp submitted the California SIWP to the State of California and the KRRC on November 16, 2021. The California SIWP described the sampling activities to be performed to confirm the presence or absence of constituents of potential concern (COPCs) at concentrations greater than selected screening levels at the RECs located in California, as identified in Section 1.3 and depicted on Figures 1-1 through 1-4.

1.1 Purpose and Objectives

PacifiCorp retained Jacobs Engineering Group Inc. (Jacobs) to develop this California Supplement and identify the process by which the remaining (i.e., not addressed in the California SIWP) Exhibit C RECs located in California will be brought forward for site assessment and closure. This California Supplement incorporates the California SIWP by reference and provides specific information necessary to address remaining RECs in accordance with the California SIWP, which was approved by the KRRC (Lowy, pers. comm. 2021) and the State of California and which was implemented when assessing the various RECs within the Copco No. 1, Copco No. 2, and Iron Gate developments (Jacobs 2021a).

The primary objective of this California Supplement is to establish the means by which the remaining Exhibit C RECs located in California will be assessed and closed per the Agreement. Secondary objectives are to identify the key environmental data that will support closure of the remaining seven RECs and outline the various sampling approaches for each REC so that as much analytical and field observational data as possible can be collected for REC closure under a single mobilization.

The field and analytical data will be used to determine and delineate the vertical and horizontal extent of potentially impacted soil, groundwater, or both, as needed, for REC closure. Waste characterization data will also be collected to help in planning a remedial action at a site. These data will be used to determine offsite disposal requirements and onsite waste segregation and management requirements for hazardous and nonhazardous waste, if encountered.

1.2 Recognized Environmental Conditions Addressed in This California Supplement

The following seven Exhibit C RECs are addressed in this California Supplement:[1]

- Condition 5 – Undiscovered Impacted Soil and Groundwater at the four Powerhouses

[1] The REC names in this list are verbatim from Exhibit C. Elsewhere in this California Supplement, "high-voltage" is hyphenated when referencing Condition 8.

- Condition 6 – Underground Storage Tanks (USTs)
- Condition 8 – High voltage switchyards
- Condition 9 – Undiscovered Impacted Soil and Groundwater at the 4 Dam Developments
- Condition 15 – Inaccessible areas
- Condition 16 – Retained easement areas
- Condition 17 – Undiscovered Impacted Soil and Groundwater outside the removal work zone

These RECs (Figure 1-1) were not included in the California SIWP because during SIWP development, the RECs were unknown, undiscoverable, or inaccessible or because REC-specific investigations could not be completed. For example: (1) Access to the Copco No. 1 and Iron Gate switchyards (Figure 1-2) was determined to be especially hazardous since the high-voltage switchyards are active; and (2) Unknown areas remain unknown until decommissioning and demolition of the dam commences. To satisfy Agreement Section 3.5(c), this California Supplement presents PacifiCorp's proposed approach to address the remaining Exhibit C RECs in a manner that will minimize disruption or delay of dam removal efforts by the KRRC and that will allow for expedited remediation or disposal of potential contaminants if identified during dam removal.

This California Supplement proposes a sampling approach for the switchyards (REC 8) that includes a figure illustrating planned soil sample locations and a table identifying media to be sampled, sample collection depths, and laboratory analyses to be performed.

The RECs identified in this California Supplement will be assessed by following the same processes, procedures, and standards that were approved for the California SIWP.

1.3 Background

The California SIWP (Jacobs 2021a) provides detailed background information on the Copco No. 1, Copco No. 2, and Iron Gate developments, a complete list of the Exhibit C RECs, and a discussion of the surrounding lands and historical practices. The California SIWP content is incorporated into this California Supplement by reference.

Pertinent to the RECs addressed in this California Supplement are the two Phase I ESAs conducted for the Oregon and California hydroelectric developments (AECOM 2018, 2020). Of the RECs identified by AECOM and documented in Exhibit C of the Agreement, PacifiCorp prepared an Oregon SIWP for the J.C. Boyle Dispersed Recreation Area (Jacobs 2021b) and a California SIWP (Jacobs 2021a) for the following RECs:

- Copco No. 1 Dynamite Cave
- Copco No. 1 Debris Piles/Scrap Yard (Parcel B REC 4)
- Wood-Stave Penstock
- Copco No. 2 Wood Pile (Parcel B REC 7)
- Copco No. 2 Powerhouse Transformer Fire (not included in Exhibit C of the Agreement)
- Copco No. 2 Former Mobile Oil Containment Building
- Underground Storage Tanks (USTs)
- Copco No. 2 Burn Pit (Parcel B REC 6)
- Iron Gate Shooting Range (Parcel B REC 9)

- Iron Gate Hatchery Burn Pit
- Iron Gate Hatchery Settling Ponds

The dams and associated powerhouses have been and continue to be operated to generate and distribute electricity until dam removal activities begin. Hazardous materials that have been used onsite include diesel fuel, leaded and unleaded gasoline, non-polychlorinated biphenyls (non-PCBs), and governor, transformer, and motor oils. Battery banks and oils are stored within secondary containment systems. As noted in the Phase I ESA conducted by AECOM, the powerhouses appeared to be in good operating condition, with proper housekeeping and hazardous materials management practices (AECOM 2018).

1.4 Investigative Standard and Future Uses

Notwithstanding any specific process or procedure identified in this California Supplement, the work performed under this California Supplement will be carried out in accordance with the Investigative Standard, as defined in Section 1.5 of the California SIWP (Jacobs 2021a). This California Supplement addresses multiple RECs, necessitating the identification of intended future uses and exposure pathways at the remaining RECs (Table 1-1). The exposure pathways will be used to determine the screening levels that were developed in Section 3.3 of the California SIWP (Jacobs 2021a). The analytical results from investigations at a REC will be evaluated against these screening levels to determine if the REC can be closed or if further assessment, remediation, risk assessment, or a combination are required.

Table 1-1. Site Future Uses and Exposure Pathways

Exhibit C REC No.	Site/REC	Site Future Use	Exposure Pathways
8	High-voltage switchyards (and substations)	Active recreation	Residential/leaching to groundwater
16	Retained Easements	Industrial	Industrial/ecological/leaching to groundwater
15	Inaccessible Areas	Passive recreation/natural habitat	Residential/ecological/leaching to groundwater
6	Underground Storage Tanks	Active recreation	Residential/leaching to groundwater
5	Undiscovered Impacted Soil and Groundwater at the Four Powerhouses	Active recreation	Residential/leaching to groundwater
9	Undiscovered Impacted Soil and Groundwater at the Four Dam Developments	Active recreation	Residential/leaching to groundwater
17	Undiscovered Impacted Soil and Groundwater Outside the Removal Work Zone	Passive recreation/natural habitat	Residential/ecological/leaching to groundwater

The Investigative Standard includes preparation of a Site Investigation Report to document the investigation and assessments performed, as described in Section 4 of the California SIWP (Jacobs 2021a).

Except as may be otherwise expressly approved in writing by PacifiCorp, KRRC, the State of California, and the State of Oregon, the implementation of any work under this California Supplement and any updates or

follow-up will constitute Jacobs' representation to PacifiCorp, KRRC, and the State of California that such work complies with the Investigative Standard as presented in the California SIWP (Jacobs 2021a).

1.5 California Supplement Organization

This California Supplement is organized into three sections and one appendix. Supporting tables and figures are located in text (Table 1-1) and at the end of text (all others). The sections and appendix are summarized as follows:

- **Section 1 – Introduction**: Describes the California Supplement purpose and objectives, identifies the RECs to be addressed, provides background information on the evolution of the RECs, and touches on investigative standards and future site uses. See Section 1 of the California SIWP (Jacobs 2021a) for complete descriptions of the program organization, program timeline, and investigative standards.
- **Section 2 – Site Evaluation and Investigation**: Describes the evaluation process for addressing the seven remaining RECs not included in the California SIWP.
- **Section 3 – References**: Provides a bibliographic listing of documents cited in this California Supplement.
- **Appendix – Consolidated Comment Matrix**: Contains consolidated review comments and responses from the KRRC and California related to this California Supplement.

2. Site Evaluation and Investigation

This section presents the results of the site investigations and evaluations conducted for the seven RECs listed in Section 1. The Sampling and Analysis Plan (Appendix A of the California SIWP) will be followed for each REC.

The High-voltage switchyards and Retained Easement RECs are evaluated because: 1) the substation, switchyard, and easement locations are known; 2) they are accessible to some degree; and 3) their environmental conditions can be reasonably evaluated in the near-term. The USTs REC is evaluated should an unknown UST be discovered during dam decommissioning or demolition. Because evaluation of undiscovered RECs is not possible at this time, this California Supplement presents a process to be implemented should impacted soil or groundwater be encountered in the subject areas during dam decommissioning and demolition.

2.1 High-voltage Switchyards (REC 8)

High-voltage switchyards and substations (collectively called switchyards here for ease of use) are connected directly to PacifiCorp's electrical generation, transmission, and distribution systems. Switchyards are integral for distributing power and maintaining stability of the local electrical grid. An abundance of high-voltage elements makes work within switchyards restricted without specialized planning. However, following further review and discussions with PacifiCorp substation operations, environmental sampling within the energized switchyards is considered possible with appropriate safety measures. Consequently, this California Supplement identifies the means and methods by which the Copco No. 1 and Iron Gate switchyards will be assessed.

The two Copco No. 2 switchyards (more precisely the Copco No. 2 230 kV Substation and the Copco No. 2 115/69 kV Substation) are not addressed in this California Supplement. PacifiCorp does not consider either of these to be a REC that need to be addressed at this time because both will remain in service for the foreseeable future and PacifiCorp retains exclusive easements per the Agreement to operate and maintain these facilities. At such time that PacifiCorp terminates operations of either facility, an assessment of conditions will be conducted consistent with the Agreement in coordination with the KRRC and California (as appropriate) and prior to extinguishing the easement.

2.1.1 Findings from Previous Investigations

The Copco No. 1 and Iron Gate switchyards were noted to contain at least one electrical transformer, substations, transmission poles, and lines within a fenced gravel area. The majority of the transmission pole footings, substations, and transformers were on top of concrete pads, and in the case of the Iron Gate substation, on top of a gravel-filled concrete catch basin. It was noted that the "yellow glass portion" of the high-voltage transformer bushings may potentially contain PCBs in the oil (AECOM 2020). PCBs could potentially be present within each of the switchyards because the Copco No. 1 Development and original supporting structures were constructed between 1911 and 1922, because the Iron Gate Development and original supporting structures were constructed between 1961 and 1962 (AECOM 2020), and because use of PCBs was not banned under the Toxic Substances Control Act until 1979.

2.1.2 Sampling Plan

Of note is that there are no records of spills or releases at the switchyards. The environmental sampling activities are being performed to confirm the presence or absence of PCBs within the switchyards. If analytical results from the initial sampling event indicate the presence of PCBs, then additional sampling

at the Copco No. 1 or Iron Gate switchyards may be performed within identified areas of concern as per 40 *Code of Federal Regulations* Part 761, Subpart N. Concrete sampling will additionally be performed for PCBs at the switchyards, and the analytical results will be used to help determine disposal options for concrete.

Prior to collecting soil samples at the Copco No. 1 switchyard, field staff will use Global Positioning System software to lay out a 25- by 25-foot sampling grid (Figure 2-1). The Iron Gate switchyard samples will be collected at the locations specifically associated with the oil-filled transformers (Figure 2-2). Field staff will note facility structures, topography, and drainage in the area and will adjust the planned sample locations as necessary. The planned sample locations will be marked for approval by the PacifiCorp substation operations group and for utility clearance prior to sampling.

The COPCs for the switchyards are PCBs and transformer oil. Consequently, soil samples will be analyzed for PCBs by U.S. Environmental Protection Agency (EPA) Method SW846 8082A and for oil and grease by EPA Method 1664. Should PCBs be detected in soil samples, EPA Method 1668 (PCB homologue method) with EPA Extraction Method SW846 3540C may be performed on select soil samples. If groundwater is encountered when collecting soil samples at the switchyards, unfiltered grab groundwater samples will be collected for submittal to the analytical laboratory. Surface gravel will be removed to allow sampling of fine-grained native soil or fine import material. Soil samples from a depth of 0.5 to 1.0 foot below native surface grade will be collected (Table 2-1 and California SIWP Appendix A [Jacobs 2021a]). The soil samples will be advanced via hand auger. Soil borings will be extended if visual observations indicate that transformer oil has migrated deeper than near surface grade.

Because the switchyards are located in a relatively flat areas immediately adjacent to the Klamath River in an otherwise steep, access-limited canyon (Figures 1-2, 1-3, 2-1, and 2-2), the most likely future use for the switchyards is active recreation (Table 1-1). Such a use will set the applicable soil and groundwater screening levels as described in California SIWP Section 1.5 and developed in California SIWP Section 3.3 (Jacobs 2021a). The validated analytical data will be evaluated against the applicable screening levels, and a site assessment report will be prepared in accordance with Section 4 of the California SIWP (Jacobs 2021a).

Data collection for the switchyard is anticipated to occur in the spring of 2023.

2.2 Retained Easement Areas (REC 6)

2.2.1 Description

Retained easement areas have been identified in Exhibit C as a PEC and are further described in that exhibit as "Any conditions in retained easement areas relating to the presence or operations of retained transmission facilities." Per the Agreement, PacifiCorp-owned property in California will be conveyed to the KRRC and eventually the State of California. As this process occurs, PacifiCorp will retain easements for the existing transmission and distribution system. Existing easements on privately- or federally-owned property are not included in this REC. Therefore, retained easements, for the purpose of this California Supplement, are defined as the right-of-way on PacifiCorp-owned property in California containing PacifiCorp electrical transmission and distribution system and all other ancillary infrastructure and related access roads. The retained easements are used for accessing, maintaining, operating, repairing, replacing, enlarging, reconstructing, or removing PacifiCorp's electrical transmission and distribution facilities.

Also included are related electrical transmission facilities such as towers, poles, pads, anchors, supports, transformers, switchyards, vaults, substations, communications facilities, fiber optic or other communications equipment, and any other improvements or facilities associated with the management of

these facilities. The retained easement area is the current physical location of the transmission facilities along with an additional area of 100 feet, as measured on the surface of the property and from each side of the transmission or distribution facility.

Retained easements were not assessed under the Phase 1 ESAs that were performed for the Copco No. 1, Copco No. 2, and Iron Gate developments (AECOM 2018; AECOM 2020), and because the retained easements were not assessed, there is potential for RECs to be present within the easements.

There are approximately 74,600 linear feet of retained easements (approximately 320 acres) over seventeen parcels (Figure 2-3).

2.2.2 Assessment Process

The assessment process for the retained easement areas is as follows:

- Perform a review of reasonably obtainable historical documents for the retained easement areas including aerial photographs, historical topographic maps, or other available property records.
- Perform a site reconnaissance survey. Qualified staff will drive through and walk accessible parts of the retained easement areas.
- Based on the evaluation and findings of the document review and site reconnaissance by a qualified environmental professional, potential new PECs may be identified. For newly identified PECs within the retained easements, determine the potential COPCs for the PEC(s), perform a site assessment(s) according to the California SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1.
- Document findings in a Site Investigation Report for PEC closure in accordance with Section 4 of the California SIWP (Jacobs 2021a). If new PECs are not identified, the Site Investigation Report will contain a recommendation for REC closure per the terms of the Agreement and the process developed with the KRRC and the State of California.

2.3 Inaccessible Areas (REC 15)

Agreement Exhibit C contains a REC for Inaccessible Areas, without further elaboration adequate to allow investigation. The draft Phase I ESA for the California and Oregon dam developments contained aerial photographs with points of interest, which at the time, were inaccessible for field reconnaissance due to either locked gates or unsafe road conditions (AECOM 2020). In response to inquiries from PacifiCorp, in April 2022, the KRRC provided further definition of the inaccessible areas (AECOM, pers. comm. 2022). The supplemental information included identification of ten specific locations within California that were subsequently summarized by PacifiCorp as requiring no further action (PacifiCorp 2022). The PacifiCorp (2022) review indicates that two of these locations are private property, one is a vehicle at a recreation site, four are rock outcroppings or vegetation, two are switchyards, and one is a vehicle parked on an access road (Table 2-2, located at the end of text). PacifiCorp is recommending that this REC be closed per the terms of the Agreement and the process developed with the KRRC and the State of California.

2.4 Underground Storage Tanks (REC 16)

2.4.1 Description

Seven USTs were identified during a Phase I ESA for the Iron Gate Fish Hatchery and the J.C. Boyle, Copco No. 1, Copco No. 2, and Iron Gate developments (AECOM 2018). One UST, potentially located near the Copco No. 2 Powerhouse, was further assessed under the California SIWP (Jacobs 2021a). The remaining

USTs, potentially located at the J. C Boyle, Copco No. 1, Copco No. 2, or Iron Gate developments, are either on private land or are considered "orphan sites" because there is insufficient information to physically locate the USTs, if still present (AECOM 2018). When ground-penetrating radar surveys were conducted by the KRRC, USTs were not identified near the Copco No. 1, Copco No. 2, and Iron Gate powerhouses or surrounding areas, as described in *Draft Buried Structures Site Investigation* (KPC 2020).

2.4.2 Assessment Process

When the KRRC is decommissioning or demolishing the Copco No. 1 Copco No. 2, and Iron Gate developments, the following assessment process will be observed if the KRRC identifies a UST or suspected UST:

- The KRRC will immediately notify PacifiCorp of the discovery. PacifiCorp will: 1) confirm that the UST is located within the Lower Klamath Project FERC boundary; 2) oversee partial exposure of the UST to determine its approximate size; and 3) determine the approximate volume of any residual contents.
- PacifiCorp will determine the potential COPCs for the UST, perform a site assessment according to the California SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1.
- PacifiCorp will coordinate UST removal actions with the Siskiyou County Environmental Health Division, which serves as the Certified Unified Program Agency (CUPA) for UST removal and case closure.
- PacifiCorp will additionally prepare a removal work plan for the UST and will obtain a removal permit that will be approved by the CUPA.
- General UST removal activities by a licensed contractor will include: 1) full exposure of the UST and preparation of the UST for removal; 2) removal and containment of residual UST contents; 3) cleaning of the UST and containment of decontamination water; 4) upon confirmation by a Certified Industrial Hygienist that the UST is inert, removal of the UST for offsite disposal.
- Upon removing the UST and as an iterative process based on health and safety and equipment capacity concerns, PacifiCorp will collect soil samples from the excavation floor and sidewalls and, if required, from expanded excavation floor and sidewalls.
- When excavating the UST and if expanding the excavation to obtain additional confirmation soil samples, PacifiCorp will segregate identified impacted soil from unimpacted soil, stockpile excavated soil on plastic sheeting, and manage stockpiled soil per regulatory requirements.
- PacifiCorp will properly transport and dispose of the UST, stockpiled soil, and decontamination wastes.
- Upon completion of excavation and confirmation sampling, PacifiCorp will return the REC to the KRRC for backfilling and compaction with an approved fill material.
- Upon completion of excavating and confirmation sampling, PacifiCorp will additionally prepare a removal report for the UST and request REC closure from the CUPA. PacifiCorp will alternatively initiate remedial process if recommended in the UST removal report.

2.5 Undiscovered Impacted Soil and Groundwater (RECs 5, 9, and 17)

2.5.1 Description

Three RECs are collectively identified as undiscovered and have the potential to contain impacted soil and groundwater. These RECs are divided into three areas: (1) the powerhouses (REC 5); (2) the dam developments (REC 9); and (3) areas outside the removal work zone (REC 17). Portions of these areas may

never be fully evaluated because they are inaccessible or cannot be accessed (for example, soil or groundwater beneath the powerhouse foundation left in place by the KRRC). Because these RECs all address the same potential issue, but at different locations, they are consolidated into a single discussion in this California Supplement.

The objective for the RECs presented in this California Supplement is to establish a process whereby impacted soil and groundwater within the RECs can be addressed if such impacts are encountered. With the standardized approach described in the next section, PacifiCorp will be able to minimize delays related to characterizing and remediating a PEC so that REC closure can be obtained in a timely manner. The approach will be employed if potential contamination associated with these three RECs is identified during dam removal.

If impacted soil or groundwater is encountered within these areas, PacifiCorp will establish whether the impacted soil and groundwater is localized or representative of a contaminant plume. PacifiCorp will then determine if there is a complete migration pathway for the contaminant to a surface water; dilution factors will additionally be assessed on a case-by-case basis if potential contamination is identified. Upon completion of a site investigation, evaluation of analytical results, and a risk assessment, PacifiCorp will determine if there is a requirement to implement some type of clean-up, containment, or monitoring program for the REC.

2.5.2 Assessment Process

This section establishes a process whereby PacifiCorp will assess impacted soil and groundwater if encountered by the KRRC when decommissioning and demolishing structures at these locations. The reasons for establishing such a process are to help ensure that:

- There is a standardized approach acceptable to the KRRC and the State of California.
- With a standardized approach in place, assessment or remediation of impacted soil and groundwater can be initiated in an expeditious manner to minimize delays associated with dam removal.
- With a standardized approach in place, PacifiCorp can minimize schedule delays and satisfactorily complete required investigative or remedial actions to obtain closure should any PECs come to light.

The stepwise approach will be formalized in a contingency plan to be developed by KRRC and PacifiCorp in advance of construction. The stepwise approach will be used when managing the undiscovered PECs, as follows:

1) Identification of Potential Contamination

The KRRC will have qualified environmental staff onsite during dam removal activities. Such staff will be qualified to collect environmental samples and perform site-specific assessments. Such staff will also be responsible for observing general site conditions and documenting if groundwater appears to be impacted or if soil has a chemical odor, is stained, or has elevated photoionization detector readings greater than 50 parts per million by volume. Should such conditions arise, such staff will report the observations and provide relevant data to PacifiCorp in writing. PacifiCorp will, in turn, mobilize a qualified team-member to further evaluate site conditions.

2) Sampling and Evaluation of Analytical Results against Established Screening Levels

Upon notification by the KRRC of impacted soil or groundwater and a PEC, PacifiCorp will enlist an environmental professional who will additionally evaluate the potential impacts.

Soil and groundwater samples will be collected as appropriate and in accordance with the California SIWP and Appendix A of the California SIWP (Jacobs 2021a). Field sampling and PEC evaluation will be coordinated with the KRRC with respect to ongoing dam removal activities to ensure that any impacts to ongoing dam removal work are minimized.

Upon receipt of the validated analytical results from sampling, the analytical results will be compared against the established screening levels for the determined future use, and recommendations will be made for PEC closure or further assessment, remediation, risk assessment, or a combination.

3) Remediation and Removal of Impacted Media

PacifiCorp recognizes that assessment and evaluation of impacted soil or groundwater may delay ongoing dam removal work at some locations. Because of this potential for delay, at PacifiCorp's discretion and in coordination with the KRRC, PacifiCorp may proceed directly to site remediation to minimize impacts on dam removal activities and progress.

Removal action in advance of testing means that PacifiCorp would manage impacted materials as outlined in the contingency plan. Potentially impacted soil or groundwater will be excavated and hauled to an approved waste staging area identified by the KRRC and as outlined in the contingency plan. Impacted soil will be segregated from unimpacted soil, and water will be properly containerized within secondary containment. Soil stockpiles will be placed on and covered with plastic sheeting, and stockpiles and containerized wastes will be inspected weekly and actively managed by PacifiCorp. Upon evaluation of the analytical results for the soil stockpiles, PacifiCorp will identify which stockpiles can be reused or disposed onsite by the KRRC and which soil stockpiles will be disposed of offsite by PacifiCorp. Containerized water will be disposed of offsite by PacifiCorp or may be reused onsite for dust suppression by the KRRC depending on the analytical results.

As part of a removal action, PacifiCorp will collect confirmation samples from excavation floors and sidewalls and will also collect soil samples from the floor and sidewalls of an expanded excavation should that be required. The confirmation samples will be analyzed for COPCs and will be evaluated against the screening levels as described in California SIWP Section 1.5 and developed in California SIWP Section 3.3 (Jacobs 2021a). Upon evaluation of the analytical results from confirmation sampling, PacifiCorp will identify if additional excavation is required or if the removal action is complete and the excavation can be backfilled and compacted (if necessary).

4) Site Investigation Report and PEC Closure

Upon completion of site assessment or remedial activities, PacifiCorp will prepare a Site Investigation Report for PEC closure in accordance with Section 4 of the California SIWP (Jacobs 2021a). The PEC will also be recommended for closure by PacifiCorp per the terms of the Agreement and the process developed with the KRRC and the State of California. If impacted soil and groundwater are not observed at completion of facilities removal for RECs 5 and 9 (dams and powerhouses) and at the completion of restoration for REC 17, then the RECs will be recommended for closure by PacifiCorp per the terms of the Agreement and the process developed with the KRRC and the State of California.

Notes:

* Hold extractions for metals, SVOCs, and dioxins/furans pending total results (TTLC).

ft bgs = feet below ground surface

NA = not applicable

STLC = soluble threshold limit concentration

TCLP = toxicity characteristic leaching procedure

TTLC = total threshold limit concentration

USEPA = U.S. Environmental Protection Agency

X = sample to be analyzed

Table 2-2. Summary of Inaccessible Area RECs

PacifiCorp, Lower Klamath Hydroelectric Project

Site Number	Conditions	AECOM Brief Description	PacifiCorp Assessment
B.6.1	Pile or Hill (041-060-090_17)	Slight discoloration from surrounding areas at top of hill, potentially a rock outcrop	This is a bedrock outcrop.
B.6.2	Building (041-040-160_21)	Housing	Private property. The noted development is not on PacifiCorp property.
B.6.3	Buildings and Accessory Structures Appear b/w 2013-2016 (041-030-170_26)	Housing	This is a trailer parked on a right-of-way to private property and is not a fixed structure.
B.6.4	Electrical Structures (004-050-010_54)	Switchyard at Copco 2	Switchyards are addressed in REC 8 and California Supplement No. 1.
B.6.5	Electrical Structures (004-050-100_56)	Switchyard at Copco 2	Switchyards are addressed in REC 8 and California Supplement No. 1.
B.6.6	Discontinuous Feature (004-050-100_63)	Lighter color on side of hill	This is a rock outcropping.
B.6.7	Treeline shifts from 2005-2006 (004-050-100_64)	Treeline shift	PacifiCorp's on-the-ground assessment indicated no activity at this location.
B.6.8	Buildings and Accessory Structures appeared between 2013 and 2016 (004-040-060_79)	Building near Copco 1 lakeshore	This is a private truck with boat trailer that was parked in the recreation site when the 2016 image was taken.
B.6.9	House (004-040-060_80)	Building near Copco 1 lakeshore	This is a private house on private property.
B.6.10	Stockpile or Hill 2011 (004-050-100_122)	Unusual-looking feature on side of hill	This is shrubs and bedrock above Copco 2 Powerhouse.

Consolidated Comment Matrix

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
California Department of Water Resources / California Department of Fish and Wildlife - Office of Spill Prevention and Response (Comments on the California Site Investigation Work Plan Supplement)					
CA-General	KT	General		CDFW-OSPR would like to conduct a site visit during the fieldwork, which PacifiCorp/Jacobs indicates will occur in the fall and winter of 2022-23. CDFW-OSPR requests PacifiCorp/Jacobs provide a schedule for fieldwork to be conducted, which will allow CDFW-OSPR to determine appropriate dates for a site visit to observe fieldwork activities and assess the effectiveness of avoidance and minimization measures that have been implemented.	If CDFW-OSPR staff are available when the PacifiCorp team is conducting this work, a site visit can be arranged. The implementation schedule has not been set, but once it is there will be limited flexibility.
CA-1	KT	High-Voltage Switchyards (REC 8)	Section 2.1, page 2-1	High Voltage Switchyards (REC 8). CDFW would like additional documentation of PacifiCorp's obligation to assess conditions prior to extinguishing the easement or otherwise terminating the use. Perhaps include text in the REC closure form and include text in the retained easement.	In the Property Transfer Agreement (Agreement) Section 3.5(a) requires that PacifiCorp resolve all pre-existing environmental conditions at its sole cost and expense to the reasonable satisfaction of the KRRC in consultation with the respective State. The sites PacifiCorp will not be able to address at closing will all have to be in the Post-Closing Environmental Resolution Agreement as a Retained Environmental Obligation (per Agreement Exhibit F). Section 2.2 of the Post-Closing Environmental Resolution Agreement repeats Agreement Section 3.5(a). Additionally, Agreement Exhibit H-1, Section B.1 states that "*Grantor shall, at its sole cost and expense, maintain the Substation Easement Areas and the Retained Substation Facilities in an orderly and safe condition and comply with all laws, including all regulatory, environmental, and safety requirements, applicable to Grantor and its activities under the Substation Easement including the use and management of the Retained Substation Facilities and the Substation Easement Areas.*" PacifiCorp interprets this as requiring PacifiCorp to do the necessary investigation and clean-up if an easement is released. No edits to Supplement No. 1 are necessary.
CA-2	KT		Section 2.1.2 Sampling Plan and Table 2-1, Page 2-2	The Supplement #1 states: "The COPCs for the switchyards are PCBs and transformer oil." Filtering is not considered appropriate for water samples to be analyzed for PCBs because contaminants that sorb to particulates are removed when filtered. We recommend that PacifiCorp/Jacobs perform a risk assessment using unfiltered data.	Section 2.1.2 of Supplement No. 1 has been modified to state the following: "If groundwater is encountered when collecting soil samples at the switchyards, unfiltered grab groundwater samples will be collected for submittal to the analytical laboratory." The groundwater samples will be analyzed for the same COPCs as the soil samples.
CA-3	KT		Section 2.1.2 Sampling Plan, Page 2-2	The Supplement #1 states: "Consequently, soil samples will be analyzed for PCBs by U.S. Environmental Protection Agency (EPA) Method SW846 8082A…" CDFW-OSPR strongly recommends that homologue analysis be used to estimate total PCBs concentrations in soil and groundwater samples. It is unclear if Aroclor-based methods or PCB congener-specific and PCB homologue methods will be used in analytical testing services for samples. The analytical method described in Valoppi et al. (2000) should be used for assessing risk of the 28 PCB congeners that exhibit dioxin-like toxicity.	The methods in Supplement No. 1 reflect current guidance from EPA and DTSC. Specifically, as recommended by DTSC in HERO guidance, *Human Health Risk Assessment Note Number 8: Recommendations for Evaluating Polychlorinated Biphenyls (PCBs) at Contaminated Sites in California* (DTSC/HERO 2020) and the *PCB Evaluation Quick Reference Guide* (DTSC 2023), soil samples will be analyzed for PCBs per EPA Method SW846 8082A. The PCB Evaluation Quick Reference Guide specifically states, "DTSC and U.S. EPA require Method 8082 for PCB analysis, and recommend Method 1668 or 680 on select samples to provide a detailed specification of PCBs in certain situations." Section 2.1.2 of Supplement No. 1 has been modified to state the following: "Should PCBs be detected in soil samples, EPA Method 1668 (PCB homologue method) with EPA Extraction Method SW846 3540C may be performed on select soil samples." This edit has also been made to OR Supplement No. 1.

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
CA-4	KT		Section 2.4.2 Assessment Process, Page 2-4	Please verify the assessment process can be accomplished without interfering with dam removal. For example, some of the bulleted actions could affect schedule (e.g. acquiring a removal permit from the CUPA [Certified Unified Program Agency]) and we're wondering if dam removal activities can proceed while the assessment process is implemented.	Whether dam removal activities could proceed should an undocumented UST (or other issue) be discovered will depend on the location and size of the UST and how quickly the CUPA would respond with issuance of a UST Removal Permit, approval of the UST Removal Work Plan, and concurrence with planned removal schedule. PacifiCorp presumes that the UST would minimally be cordoned with temporary fencing, etc., and that dam removal activities would resume while permitting and the approvals process for UST removal proceeds. Per discussion with the CUPA on October 5, 2022, the turnaround time for UST removal upon discovery and under purview by the CUPA is approximately 1 week from submittal of a proper UST removal permit application with proper UST removal work plan. No edits to Supplement No. 1 are necessary.
CA-5	KT		Section 2.5 Undiscovered Impacted Soil and Groundwater (RECs 5, 9, and 17), Page 2-4	The Supplement #1 indicates: "*The objective for the RECs presented in this California Supplement is to establish a process whereby impacted soil and groundwater within the RECs can be addressed if such impacts are encountered.*" CDFW-OSPR requires PacifiCorp/Jacobs ensure contaminants which may enter State waters are not at levels deleterious to fish, mammals, plant life or bird life (Fish and Game Code section 5650). The California Fish and Game Code identifies "*Fish*" as "*a wild fish, mollusk, crustacean, invertebrate, amphibian, or part, spawn, or ovum of any of these animals.*" CDFW-OSPR suggests that the PacifiCorp/Jacobs continue to monitor contaminant concentrations in surface water if PacifiCorp/Jacobs detects concentrations over the project action limit in ground water.	PacifiCorp is currently not required to monitor contaminant concentrations in surface water within the dam developments as they exist now. Before performing such monitoring, impacted soil or groundwater would first have to be encountered within features associated with REC 5, 9, or 17. Section 2.5.1 of Supplement No. 1 has been modified to read as follows: "If impacted soil or groundwater is encountered within these areas, PacifiCorp will establish whether the impacted soil and groundwater is localized or representative of a contaminant plume. PacifiCorp will then determine if there is a complete migration pathway for the contaminant to a surface water; dilution factors will additionally be assessed on a case-by-case basis if potential contamination is identified. Upon completion of a site investigation, evaluation of analytical results, and a risk assessment, PacifiCorp will determine if there is a requirement to implement some type of clean-up, containment, or monitoring program for the REC." This same edit has been made to OR Supplement No. 1.
CA-6	KT		Section 2.5 Undiscovered Impacted Soil and Groundwater (RECs 5, 9, and 17), Page 2-4	Once potential contamination is identified, please provide dilution factors for transport between groundwater and surface water. If sufficient validation is not available for a specific dilution factor, please make the conservative assumption that there is no dilution of contaminants between ground and surface waters.	Please see the response to CA-5.
CA-7	KT		Section 2.5.2 Assessment Process, Page 2-5	Same comment as #4 [CA-4] above. CDFW notes that PacifiCorp acknowledge in the Supplement that assessment and evaluation of impacted soil or groundwater may delay ongoing dam removal work at some locations. Is there other contingency planning that could occur with KRRC?	PacifiCorp is fully aware of the potential implications from any discovered issues to affect the overall project schedule. Item 3 on page 2-5 indicates that PacifiCorp may proceed directly to clean-up of a suspect location, stockpile the material, and then do the assessment and evaluation necessary to determine the scope of the issue, if any. Rapid removal in close coordination with the KRRC team is the best way to minimize potential effects on the dam removal work schedule. PacifiCorp has confirmed that the KRRC will have a plan to address this issue should it occur (Morton D. McMillen, McMillen Jacobs Associates, to Demian Ebert, PacifiCorp, on October 31, 2022, at 6:19 AM). Section 2.5.2 of Supplement No. 1 has been modified to read as follows: "The stepwise approach will be formalized in a contingency plan to be developed by KRRC and PacifiCorp in advance of construction. The stepwise approach will be used when managing the undiscovered PECs, as follows:..."

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
CA-8	KT		Section 2.5.2 (1) Identification of Potential Contamination, Page 2-5	Please confirm PacifiCorp's assumption is correct that KRRC will have environmental staff onsite that can identify hazardous materials.	McMillan Jacobs Associates is the KRRC's representative for removal. McMillan Jacobs Associates confirmed that they will have environmental staff onsite during all removal work and a contractual relationship with a firm qualified to collect samples and do a site-specific assessment (Morton D. McMillen, McMillen Jacobs Associates, to Demian Ebert, PacifiCorp, on October 31, 2022, at 6:19 AM). Section 2.5.2 (1) of Supplement No. 1 has been modified to read as follows: "The KRRC will have qualified environmental staff onsite during dam removal activities. Such staff will be qualified to collect environmental samples and perform site-specific assessments."
CA-9	KT		Section 2.5.2 (3) Remediation and Removal of Impacted Media, Page 2-5	Please confirm that KRRC has identified an approved waste staging area. If possible, please also confirm that the waste staging area can accommodate the potential materials that could be discovered. Please also determine if RES intends to use a certain amount of soil for restoration such that any contaminated soil that can't be reused would impact restoration plans. We're wondering what sort of adjustments, if any, RES (or the team) would need to make if all the soil can't be reused onsite.	Because these particular RECs are currently unknown and unknowable, clean-up actions cannot be developed, and selection of specific stockpile locations or potential uses of excess material have not been developed. However, PacifiCorp expects that development of a detailed contingency plan (see response to CA-7) will be developed before the start of construction. That plan would be coordinated with the KRRC's team to identify waste staging areas, stockpile management, soil reuse, backfill and compaction, and offsite disposal requirements all with an eye toward reducing potential conflicts and schedule impacts on the dam removal project. Section 2.5.2 (3) of Supplement No. 1 has been modified to read as follows: "Removal action in advance of testing means that PacifiCorp would manage impacted materials as outlined in the contingency plan. Potentially impacted soil or groundwater will be excavated and hauled to an approved waste staging area identified by the KRRC and as outlined in the contingency plan." The corresponding edit has been made to OR Supplement No. 1.
CA-10	KT		Section 2.5.2 (4) Site Investigation Report and PEC Closure, Page 2-6	CDFW requests that RECs not be closed by default. Instead, PacifiCorp should acquire CDFW's and KRRC's concurrence prior to closing the REC.	Section 2.5.2 (4) of Supplement No. 1 has been modified to read as follows: "If impacted soil and groundwater are not observed at completion of facilities removal for RECs 5 and 9 (dams and powerhouses) and at the completion of restoration for REC 17, then the RECs will be recommended for closure by PacifiCorp per the terms of the Agreement and the process developed with the KRRC and the State of California."

* KT = Kevin Takei

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
Klamath River Renewal Corporation (Comments on the California and Oregon Site Investigation Work Plan Supplements)					
KRRC-General	LL			I should add, as a general matter, that KRRC incorporates the States' comments.	Acknowledged.
KRRC-1	LL	CA Supplement	Section 1.2, last paragraph	Please rephrase as "The RECs identified in this California Supplement will be assessed by following the same processes, procedures, and standards provided for in the California SIWP."	The KRRC and State of California approvals of the California SIWP are recommended in the document in order to establish precedence for use of the same processes, procedures, and standards when assessing the RECs identified in the California Supplement. The last sentence of the first paragraph in Section 1.1 in Supplement No. 1 now reads as follows: "This California Supplement incorporates the California SIWP by reference and provides specific information necessary to address remaining RECs in accordance with the California SIWP, which was approved by the KRRC (Lowy, pers. comm. 2021) and the State of California and which was implemented when assessing the various RECs within the Copco No. 1, Copco No. 2, and Iron Gate developments (Jacobs 2021a)." The last paragraph of Section 1.2 in Supplement No. 1 now reads as follows: "The RECs identified in this California Supplement will be assessed by following the same processes, procedures, and standards that were approved for the California SIWP."
KRRC-2	LL	CA Supplement	Section 1.4	""Notwithstanding any specific process or procedure identified in this California Supplement, …"	This text has been incorporated into the document.
KRRC-3	LL	CA Supplement	Section 1.4, Table 1-1	What was the basis for determining the future uses of the different areas? For example, I question whether it's correct to refer to the future uses of all of the retained easements as industrial – certainly some areas are but outside of the exclusive easement areas I'm not sure that's the case.	The future uses listed in Table 1-1 were confirmed by the State of California on November 7, 2022 (Kevin Takei, State of California, to Demian Ebert, PacifiCorp, November 8, 2022, at 12:10 p.m.) and have been incorporated into Supplement No. 1.
KRRC-4	LL	CA Supplement	Section 2.1	Please state the methodology for quantity of samples and grid spacing etc. KRRC suggests the EPA methodology (40 CFR Part 761, Subpart N) for characterizing the media.	Section 2.1.2 of Supplement No. 1 has been modified to read as follows: "Of note is that there are no records of spills or releases at the switchyards. The environmental sampling activities are being performed to confirm the presence or absence of PCBs within the switchyards. If analytical results from the initial sampling event indicate the presence of PCBs, then additional sampling at the Copco No. 1 or Iron Gate switchyards may be performed within identified areas of concern as per 40 *Code of Federal Regulations* Part 761, Subpart N. Concrete sampling will additionally be performed for PCBs at the switchyards, and the analytical results will be used to help determine disposal options for concrete."
KRRC-5	LL	CA Supplement	Section 2.1, second paragraph	The assertion that the retained easement areas in the high-voltage switchyards will not be assessed at this time is not something that, as far as I know, has been discussed previously with KRRC. I understand the rationale and don't necessarily object but that discussion should take place. If that is, in fact, where we end up, then PacifiCorp's obligation to assess and remediate these easement areas at a much later date will need to be expressly identified in the Post-Closing Environmental Resolution Agreement and the reservation of easements, and carved out of any closure of any other retained easement areas.	Please see the response to CA-1.

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
KRRC-6	LL	CA Supplement	Section 2.1.2, penultimate (second-to-last) paragraph	The likely future use of the switchyard areas should be determined at the relevant time in consultation with California and, if applicable, KRRC rather than being assumed by PacifiCorp.	Please see the response to KRRC-3.
KRRC-7	LL	CA Supplement	Section 2.2.1, second paragraph	I believe this acknowledges that the easement area extends 100 feet on each side of the transmission and distribution facilities – please confirm or rephrase accordingly.	The text of the California Supplement correctly states that the retained easements for the transmission and distribution system is the location of existing structures buffered by 100 feet on either side of the line. No edits to Supplement No. 1 are necessary.
KRRC-8	LL	CA Supplement	Section 2.4.2, second bullet	The likely future use of the areas within UST footprints should not be determined by PacifiCorp but rather by KRRC and California.	Please see the response to KRRC-3.
KRRC-9	LL	CA Supplement	Section 2.5.2, paragraph 1	There should be a discussion regarding the extent to which KRRC will have environmental staff onsite during dam removal and the process should be tailored around that.	Please see the response to CA-8.
KRRC-10	LL	CA Supplement	Section 2.5.2, paragraph 3	I'm not sure what "PacifiCorp's discretion in coordination with KRRC" means in this context; a decision to proceed to remediation without investigation should not be made by PacifiCorp without first consulting KRRC; same for deciding which soil stockpiles are to be reused or disposed of onsite.	The goal of this entire item is to reduce the potential for the overall dam removal project to be delayed by the need to investigate, analyze, and then clean-up a newly discovered potential contamination site. Instead, if contamination is identified as potentially present, PacifiCorp may at its discretion, and in consultation with the KRRC, proceed to clean-up a suspected site simply to expedite the overall removal project. Management of soil would be detailed in a contingency plan (see response to CA-9). Section 2.5.2 (3) of Supplement No. 1 has been modified to read as follows: "Because of this potential for delay, at PacifiCorp's discretion and in coordination with the KRRC, PacifiCorp may proceed directly to site remediation to minimize impacts on dam removal activities and progress."
KRRC-11	LL	OR Supplement	Section 1.2, last paragraph	Please rephrase as "The RECs identified in this Oregon Supplement will be assessed by following the same processes, procedures, and standards provided for in the Oregon SIWP."	The KRRC and State of Oregon approvals of the Oregon SIWP are recommended in the document in order to establish precedence for use of the same processes, procedures, and standards when assessing the RECs identified in the Oregon Supplement. The last sentence of the first paragraph in Section 1.1 of Supplement No. 1 now reads as follows: "This Oregon Supplement incorporates the Oregon SIWP by reference and provides specific information necessary to address remaining RECs in accordance with the Oregon SIWP, which was approved by the KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021) and which was implemented when assessing J.C. Boyle Dispersed Recreation Area - 2 (Jacobs 2021a)." The last paragraph of Section 1.2 in Supplement No. 1 now reads as follows: "The RECs identified in this Oregon Supplement will be assessed by following the same processes, procedures, and standards that were approved for the Oregon SIWP."

COMMENT MATRIX for the External Review Draft Dated August 2022
Lower Klamath Hydroelectric Project Site Investigation Work Plan Supplement No. 1
FERC No. P-14803
January 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No.	Comment	Response to Comment
KRRC-12	LL	OR Supplement	Section 1.4, first paragraph	Please add the following at the beginning of the first sentence: ""Notwithstanding any specific process or procedure identified in this Oregon Supplement, …"	This text has been incorporated into the document.
KRRC-13	LL	OR Supplement	Section 1.4, Table 1-1	What was the basis for determining the future uses of the different areas? For example, I question whether it's correct to refer to the future uses of the retained easements as industrial as there are not any exclusive easement areas in Oregon.	The future uses listed in Table 1-1 were based on the uses for various areas as established in the SIWP. The review process for the draft Final Supplement was intended to ensure that future uses conformed with Oregon's ultimate vision for these locations. Per Oregon's recommendation, the future use for retained easements has been changed to Active Recreation per Oregon's comment (see Comment OR-1).
KRRC-14	LL	OR Supplement	Section 2.1	The Oregon Supplement only indicates sampling of the sub-surface soil. KRRC believes PacifiCorp should also sample the gravel and the concrete, as it will be relocated or disposed of.	Soil beneath gravel would be expected to be impacted by potential PCB or dielectric fluid spills. If PCBs were present in potential spills, the PCBs would have been washed through the gravel and attached to the fines in the soil. The gravel is not expected to contain much fine material and those fine materials are needed to run the analytical tests. The following text has been added to Section 2.1 of Supplement No. 1: "Concrete sampling will additionally be performed for PCBs at the switchyard, and the analytical results will be used to help determine disposal options for concrete."
KRRC-15	LL	OR Supplement	Section 2.2.2, third bullet	Again, future uses of that portion of the property should be determined by consulting KRRC and Oregon.	The future site uses as shown in Table 1-1 have been approved by the KRRC and Oregon. The second sentence of this bullet has been modified to read: "For newly identified PECs within the retained easements, determine the potential COPCs for the PEC(s), perform a site assessment(s) according to the Oregon SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1." The corresponding edit has been made to CA Supplement No. 1.
KRRC-16	LL	OR Supplement	Section 2.4.2, second bullet	Same comment as 2.2.2 [KRRC-15].	The future site uses as shown in Table 1-1 have been approved by the KRRC and Oregon. The text of this bullet has been modified to read: "PacifiCorp will determine the potential COPCs for the UST, perform a site assessment according to the Oregon SIWP (Jacobs 2021a), and evaluate the analytical results against the screening levels for the future uses and exposure pathways established in Table 1-1." The corresponding edit has been made to CA Supplement No. 1.
KRRC-17	LL	OR Supplement	Section 2.5.2, paragraph 1	There should be a discussion regarding the extent to which KRRC will have environmental staff onsite during dam removal and the process should be tailored around that.	Please see the response to CA-8. The corresponding edit has been made to Oregon Supplement No. 1.
KRRC-18	LL	OR Supplement	Section 2.5.2, paragraph 3	A decision to proceed to remediation without investigation should not be made by PacifiCorp without first consulting KRRC; same for deciding which soil stockpiles are to be reused or disposed of onsite	Please see the response to KRRC-10. The corresponding edit has been made to Oregon Supplement No. 1.

Oregon Department of Justice (Comments on the Site Investigation Work Plan Supplements)					
OR-1	CM		General	Oregon joins in the comments by KRRC and the Golden State. Our only specific comment is that we believe the future uses described for the retained easement areas in Oregon are incorrect – the land is not "industrial" as the likely exposure pathway will actually be "active recreation" (as none of the areas are exclusively for use by PacifiCorp – these are transmission line easements). Therefore those areas will need to be remediated (as necessary) to the higher standard.	The future use for the retained easements has been changed to Active Recreation. Also, please see the response to KRRC-13.

1. Introduction

PacifiCorp retained Jacobs Engineering Group Inc. (Jacobs) to prepare this *Oregon Site Investigation Report* (Oregon SI Report) for the Lower Klamath Hydroelectric Project (Project). The purpose of the Oregon SI Report is to document the environmental sampling activities performed at the location of one pre-existing environmental condition, the J.C. Boyle Dispersed Recreational Area – 2 (site), within the J.C. Boyle Development in Oregon. The site was identified during a Phase I environmental site assessment (Phase I ESA) conducted by AECOM Technical Services, Inc. (AECOM) on behalf of the Klamath River Renewal Corporation (KRRC) and was subsequently identified in Exhibit C of a Property Transfer Agreement (Agreement) between PacifiCorp and the KRRC.

The environmental sampling activities were performed according to the *Oregon Site Investigation Work Plan* (Oregon SIWP) (Jacobs 2021a) to confirm the presence or absence of constituents of potential concern (COPCs) at the site (Figure 1-1).

The Oregon SIWP was approved by the KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021). A separate *California Site Investigation Work Plan* (California SIWP) was developed for Exhibit C sites located within the Copco No. 1, Copco No. 2, and Iron Gate developments (Jacobs 2021b). PacifiCorp has prepared a *California Site Investigation Report* (Jacobs 2023) in accordance with Section 4 of the California SIWP.

1.1 Background

The Oregon SIWP provides detailed backgrounds of the J.C. Boyle Development and a discussion of the site, surrounding lands, local geology, and historical practices (Jacobs 2021a). This information is incorporated into the Oregon SI Report by reference.

Also pertinent to the site are two Phase I ESAs conducted for the Oregon and California hydroelectric developments (AECOM 2018, 2020a).

Of importance to note regarding the site and the development of each SIWP are the following:

- There were no records of spills/releases at the site, and the actual site conditions were not known.
- The sampling plan for the site was developed consistent with industry standards and was based on assumed conditions at the site.
- The site-specific sampling plan was developed to determine if the COPCs (summarized in Table 1-1) are present at concentrations that exceed the screening levels.
- The COPCs and screening levels for the site were selected based on the most conservative (i.e., lowest) residential, ecological, and leaching to groundwater screening levels and on the understood future site use, as agreed upon by the KRRC and the State of Oregon.

The J.C. Boyle Dam and associated powerhouse have been and continue to be operated to generate and distribute electricity. Hazardous materials that have been used onsite include diesel fuel, leaded and unleaded gasoline, non-polychlorinated biphenyls, and governor, transformer, and motor oils. Battery banks and oils are stored within secondary containment systems. As noted in the Phase I ESA conducted by AECOM, the powerhouses appeared to be in good operating condition, with proper housekeeping and hazardous materials management practices (AECOM 2018).

1.2 Objectives

The primary objective of this Oregon SI Report is to document the field activities and analytical results. Those analytical results support one of the following recommended actions for the site:

- No further action and site closure
- Additional assessment through field sampling
- Development of a remedial action plan

Recommended next steps are provided for the site based on the results of the risk evaluation. Recommended next steps consist of a request for site closure, collection of additional environmental samples, or a soil removal action (Figure 1-2). If risk evaluation of the analytical results indicates acceptable risk, PacifiCorp will request closure of the site. As used in this report, site closure refers to a closure action agreed upon by PacifiCorp, KRRC, and Oregon and documented in a Memorandum of Resolution. If analytical results of COPCs indicate the risk is unacceptable, PacifiCorp will either propose advancement of step-out borings to collect additional samples according to the sampling plan established for the site or develop a remediation plan based on the field and analytical data already collected.

1.3 Investigative Standard and Future Site Uses

The COPCs for the site (Table 1-1) were determined based on the Investigative Standard, as defined in Section 1.5 of the Oregon SIWP (Jacobs 2021a), on expectations for the type of site identified. All fieldwork and data evaluations were carried out in accordance with the Investigative Standard. The COPCs, intended future site uses, and exposure pathways for the site (Table 1-1) were identified in the Oregon SIWP and approved by KRRC and the State of Oregon. The exposure pathways were used to determine the screening levels developed in Section 3.3 of the Oregon SIWP and utilized when evaluating the analytical results in Section 4.

Table 1-1. Constituents of Potential Concern, Future Site Uses, and Exposure Pathways

Site	Constituents of Potential Concern	Future Site Uses	Exposure Pathways
J.C. Boyle Dispersed Recreation Area – 2	Title 22 metals, VOCs SVOCs, dioxins and furans	Passive recreation/natural habitat	Residential/Ecological/Leaching to Groundwater

Notes:
SVOCs = semivolatile organic compounds
VOCs = volatile organic compounds

1.4 Report Organization

The Oregon SI Report contains the following section and appendixes:

- **Section 1 – Introduction**: Describes the Oregon SI Report purpose, provides background information on the evolution of the site, objectives of the Oregon SI Report, the Investigative Standard utilized, future uses, applicable receptor pathways, and COPCs for the site.
- **Section 2 – Field Activities**: Provides a general overview of the field activities performed during Oregon SIWP implementation.
- **Section 3 – Risk Assessment Approach**: Describes the general risk assessment approach used to evaluate human health risk, leaching to groundwater, and ecological risk from COPCs.

- **Section 4 – J.C. Boyle Dispersed Recreation Area – 2**: Describes the site-specific field activities, analytical results, risk assessment, and recommended actions.
- **Section 5 – Summary of Recommendations:** Summarizes the recommendations for further action at the site.
- **Section 6 – References**: Provides a bibliographic listing of documents cited in the report.
- **Appendix A – Boring Logs**: Provides coordinates for borehole locations based on Global Positioning System (GPS) surveys, borehole logs, and photographs of borehole locations at the site.
- **Appendix B – Waste Manifests**: Contains the waste manifests used for transport and disposal of the generated wastes.
- **Appendix C – Analytical Laboratory Results**: Provides the analytical laboratory results of all samples collected from each of the boreholes and highlights results that exceeded a screening level.
- **Appendix D – Data Quality Evaluation Report**: Assesses the data quality of the analytical results for soil and water samples collected at the site.
- **Appendix E – Human Health and Leaching to Groundwater Evaluation Tables**: Provides the supporting tables of calculations for the human health risk evaluation and leaching to groundwater evaluation for the site.
- **Appendix F – Ecological Risk Evaluation Tables**: Provides the supporting tables of calculations for the site ecological risk evaluation.
- **Appendix G – Consolidated Comment Matrix**: Contains consolidated review comments and responses from California, KRRC, and Oregon on the stakeholder review draft dated October 2022 as well as supplemental comments received and discussed following the initial round of comments.

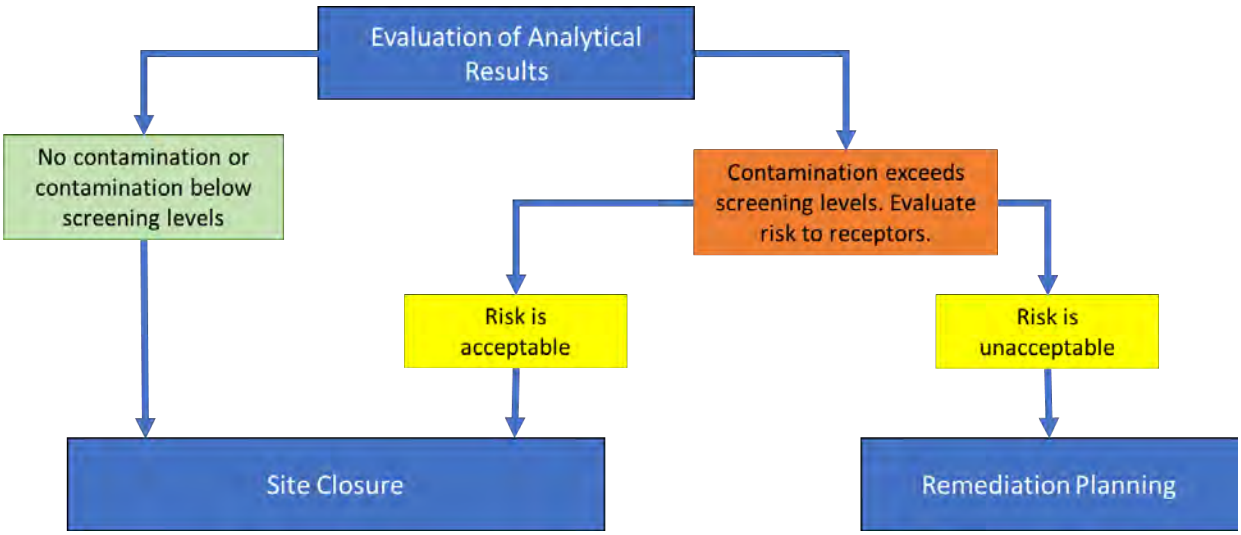

Figure 1-2. Flowchart of Possible Next Steps

2. Field Activities

The Oregon SIWP was implemented under a single mobilization that was performed in May 2022. Field activities were documented daily in field logbooks and on tablets. The scope of work specific to the site was implemented as outlined in the SIWP. Field activities primarily included the following:

- Soil borings were marked based on their planned coordinates from the Oregon SIWP.
- The marked soil borings were cleared for the presence of subsurface utilities by a subcontracted utility locator service and were moved if subsurface utilities were identified, or as required based on field conditions.
- A hand auger was used to advance each cleared soil boring.
- Soil samples were collected at specified sample intervals, for headspace analysis with a photo-ionization detector, and for borehole logging purposes.
- Collection of soil samples for analysis of site-specific COPCs was conducted as identified in the Oregon SIWP. Soil sampling was performed in accordance with Oregon SIWP Appendix A (Sampling and Analysis Plan).
- Grab groundwater samples were collected with disposable bailers and from temporary wells constructed with 3/4-inch-diameter Schedule 40 polyvinyl chloride blank casing and 5 feet of slot screen. Upon collecting the groundwater samples, the temporary well casing was removed so that the soil boring could be abandoned.
- All soil borings were surveyed with a hand-held GPS unit. The final survey coordinates and the boring logs for each soil boring are presented in Appendix A of this Oregon SI Report.
- Upon completion of sampling activities, each soil boring was abandoned with hydrated bentonite pellets.
- Waste soil and water samples were collected for waste characterization and profiling purposes prior to offsite disposal according to applicable state and federal requirements and Section 2.1.

Details of the specific soil sampling activities for this site are summarized in Sections 4.

2.1 Waste Management

Wastes generated from soil sampling activities included general refuse, soil cuttings from hand auguring, and rinsate water from decontamination of equipment. General refuse was disposed of in trash bins used by PacifiCorp. Soil cuttings and rinsate water were segregated by waste type and were contained in labeled, United Nations (UN)-approved 5-gallon buckets staged within a secured area.

Waste samples were collected for waste profiling purposes. Upon waste characterization and acceptance by the landfill operator, Waste Management, waste soil was consolidated in UN-approved 55-gallon drums for transport by the waste transporter, EnviroServe, Inc., and disposal as nonhazardous waste at Waste Management's Hillsboro Landfill in Hillsboro, Oregon. Upon waste acceptance by the oil recycler, Oil Re-Refining, wastewater was consolidated in a UN-approved 55-gallon drum for transport and disposal as nonhazardous wastewater by EnviroServe, Inc. at Oil Re-Refining in Portland, Oregon. Waste manifests and bills of lading are compiled in Appendix B.

2.2 Sample Collection and Management

The soil samples were collected in glass jars or TerraCore kits provided by the analytical laboratory and in accordance with the Sampling and Analysis Plan (Appendix A of the Oregon SIWP). The soil samples were labeled, placed in resealable plastic bags, and stored in an insulated cooler that was chilled to maintain a shipping temperature of about 4 degrees Celsius. The sample cooler contained a temperature blank used for recording the temperature of samples in the cooler upon arrival at the laboratory. For coolers containing volatile organic compound (VOC) samples, a trip blank was used to assess the possibility of cross-contamination when transporting the samples to the laboratory. A chain-of-custody form was completed in the field and accompanied all soil samples during transport to the analytical laboratory, Eurofins Seattle, in Tacoma, Washington (Appendix C). All laboratory analyses were performed in accordance with current U.S. Environmental Protection Agency (EPA) procedures and by a laboratory certified by the Oregon Environmental Laboratory Accreditation Program.

3. Risk Assessment Approach

This section describes the general risk assessment approach used to evaluate human health risk, leaching to groundwater, and ecological risk from COPCs in soil and water at J.C. Boyle Dispersed Recreation Area - 2. Risk managers used the results of this analysis to support risk management decisions for the site.

3.1 Human Health Risk Assessment

A streamlined human health risk assessment (HHRA) was conducted to evaluate human health risk to applicable receptors from exposure to contaminants in soil. The HHRA provides information that can support risk-management decision making, including the need for further action.

A screening-level HHRA was conducted for the J.C. Boyle Dispersed Recreation Area - 2 by comparing COPC concentrations in soil and shallow groundwater to the Oregon Department of Environmental Quality (ODEQ) *Risk-Based Concentrations for Individual Chemicals in Soil* (ODEQ 2018).

The risk evaluation approach is based on Oregon environmental cleanup regulations, which require a risk-based approach for assessing and managing environmental contamination from releases of hazardous substances under the state's hazardous substance remedial action rules (Oregon Administrative Rules 340-122-0100 through 340-122-0115). The risk evaluation was conducted in accordance with *Risk-Based Decision Making for the Remediation of Contaminated Sites* (ODEQ 2017).

The HHRA framework generally consists of the following four basic steps (EPA 1989):

1) Data Evaluation: The first step consists of reviewing and evaluating available data, identifying COPCs in site media.
2) Exposure Assessment: The second step involves evaluating potential exposure pathways for COPCs and the potential human populations that could be exposed to them, either now or in the future. Exposure point concentrations (EPCs) are estimated from measured or modeled concentrations, and pathway-specific exposure parameters and assumptions are evaluated.
3) Toxicity Assessment: The third step considers the toxicity values that characterize potential adverse health effects from exposure to COPCs.
4) Risk Characterization**:** The fourth step combines the results of the previous three steps to characterize potential risks to human health associated with exposure to COPCs.

These steps are described in the following sections.

3.1.1 Data Evaluation

Before conducting the risk assessment, the analytical results from sampling (Appendix C) were validated in a data quality evaluation report (Appendix D). The suitability of the analytical results was then evaluated for use in the risk assessment. The following data reduction steps were taken:

- Estimated values (flagged with "J" qualifiers) were treated as detected concentrations.
- For naphthalene analysis, where Methods SW8270C and SW8260B were both used, the greater detected result was retained. If there were two nondetections, the result having the lower detection limit was retained.
- Native and duplicate (field duplicates) sample pairs were reduced as follows:
  - If there were two detections, the greater of the two concentrations was used.

- If there was one detection and one nondetection, the detected value was used.
- If there were two nondetections, the result having the lower detection limit was used.

The data evaluation step includes the selection of human health COPCs that were included in the HHRA. Human health COPCs were identified based on an initial screening evaluation through which maximum detected concentrations (MDCs) for each analyte were compared to conservative screening levels for soil and groundwater. The risk-based screening levels used to select human health COPCs are the most conservative ODEQ soil and groundwater risk-based concentrations (RBCs) (ODEQ 2018) for a residential exposure scenario. If no ODEQ RBCs are available, the EPA (2022) residential soil regional screening level (RSL) or tapwater (drinking water) RSL was used. Background values are used for soil if available and if greater than RSLs.

The COPCs in the HHRA (Appendix E) include analytes that exceed the ODEQ residential RBCs and exceed background values, if available.

3.1.2 Exposure Assessment

Potential future receptors are recreational users and construction workers. Although not considered to be a potential future land use, a hypothetical residential scenario was considered for risk management purposes (i.e., unrestricted land use)

Potential risks to human health for future recreational and construction worker exposure scenarios and the hypothetical future residential scenario were evaluated, and assume that the following pathways are potentially complete:

- Future recreational users could potentially be exposed to surface soil, defined as 0 to 2 feet below ground surface (bgs), and mixed-zone soils (0 foot to 10 feet bgs) if subsurface soil is brought to the surface in the future. Potentially complete routes of exposure to surface or mixed-zone soil include incidental ingestion, dermal contact, and inhalation of suspended soil particulates (dust) and vapors volatilizing from the soil surface to air.
- Future construction workers could potentially be exposed during construction activities (e.g., excavation) to surface soil and mixed-zone soils through incidental ingestion, dermal contact, and inhalation of suspended soil particulates (dust) and vapors volatilizing from the soil surface to air. Future construction workers could potentially be exposed during construction activities to shallow water through direct contact.
- Hypothetical future residents could potentially be exposed to surface soil and mixed-zone soils. Potentially complete routes of exposure to soil include incidental ingestion, dermal contact, and inhalation of suspended soil particulates (dust) and vapors volatilizing from the soil surface to air. Shallow groundwater samples collected at approximately 2 to 3 feet bgs are not considered to be applicable for future use of groundwater for drinking water.

An exposure area describes a location or area where humans might encounter one or more contaminated environmental media on a regular basis. Because of the small size of the site, it was evaluated as one exposure area.

3.1.2.1 Exposure Point Concentrations

EPCs for soil were calculated for each COPC and depth interval (surface soil and mixed zone soil) evaluated. The data from a depth interval were grouped to calculate an upper-bound average concentration for each COPC, which was used in the risk calculations as the EPC. For data sets that have a sufficient number of data points, a 95 percent upper confidence limit (UCL) on the mean was calculated for each COPC in soil using the latest version of EPA's ProUCL software, version 5.2 (EPA 2022b, 2022c).

Treatment of nondetections in the derivation of the EPC were addressed using ProUCL software. ProUCL input and output are provided in Appendix E.

Maximum concentrations are used as the EPCs where the data exhibit high variance, the sample size is fewer than five, there are fewer than four detected values, or the 95 percent UCL is greater than the maximum concentration. In cases where there are fewer than four detected values, the mean value may be selected in accordance with EPA (2016) guidance regarding EPCs.

3.1.2.2 Exposure Parameters

Default exposure parameters used to develop the RBCs are provided in ODEQ guidance (ODEQ 2017). The RBCs are provided in Section 4 tables.

3.1.3 Toxicity Assessment

The toxicological data used to develop the RBCs are provided in ODEQ guidance (ODEQ 2017). The RBCs are provided in Section 4 tables.

3.1.4 Risk Characterization

EPCs of COPCs in soil were compared with the ODEQ RBCs for residential and construction worker exposure scenarios. The conservative residential RBCs were used to evaluate risk to both the future recreational user and the hypothetical future resident.

Maximum detected concentrations of COPCs in shallow groundwater were compared with the ODEQ RBCs for construction and excavation workers.

3.2 Leaching to Groundwater Evaluation Approach

The leaching to groundwater evaluation predicts the attenuation that will occur as constituents leach from vadose zone soil into groundwater. COPCs for the potential leaching to groundwater pathway are the chemicals in soil with MDCs exceeding the ODEQ residential leaching to groundwater RBCs (ODEQ 2018). The RBCs are provided in Section 4 (Table 4-5). The potential for a complete migration to groundwater pathway is also evaluated by considering whether COPCs have migrated from historical surface releases, if contamination is delineated laterally and vertically, and how contaminant depths compare with estimated or measured depths to groundwater.

3.3 Ecological Risk Assessment

A streamlined ecological risk assessment (ERA) was completed for the site to evaluate potential risks to ecological receptors from contaminants in soils under current and potential future land use conditions. The results of the streamlined ERA will be used in conjunction with the human health risk assessment and leaching to groundwater evaluation to provide risk managers with information needed to support risk management decisions for the site.

The streamlined ERA was performed in general accordance with EPA and ODEQ guidance as follows:

- *The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (EPA 2001)
- *Guidelines for Ecological Risk Assessment* (EPA 1998)

- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (EPA 1997)
- *Conducting Ecological Risk Assessments* (ODEQ 2020)

The streamlined ERA was conducted in a phased approach as follows (Figure 3-1):

- Step 1 – Screening Evaluation: The screening evaluation consists of a very conservative (i.e., protective of the most sensitive ecological receptors) screen of sample-specific detected results for the site compared to available background threshold values (BTVs) and the No Effect Ecological Screening Level (No Effect ESLs). No Effect ESLs are based on no observed adverse effect levels for plants and wildlife and chronic effects for aquatic life. Chemicals with observed concentrations that do not exceed the No Effect ESLs are considered to not pose a potential risk to ecological receptors and are eliminated from further evaluation. Chemicals with detected concentrations exceeding the No Effect ESLs are carried forward to Step 2 (Refined Evaluation).
- Step 2 – Refined Evaluation: The refined evaluation consists of a comparison of sample-specific results against a Low Effect ESL that is based on a lowest observed adverse effect level (LOAEL) for wildlife or the acute effects for aquatic life. The chemicals with observed concentrations that do not exceed the Low Effect ESLs are considered to not pose a significant risk to ecological receptors. Chemicals with detections exceeding the Low Effect ESLs for soil are carried forward to Step 3 (Site-Specific Evaluation). Chemical with detections exceeding the Low Effect ESLs for groundwater exposures are carried forward to Step 4 (Weight of Evidence Evaluation).
- Step 3 – Site-Specific Evaluation: The site-specific evaluation consists of a comparison of sample-specific detected results against site-specific ecological preliminary remedial goals (EcoPRGs) for soil that are developed for avian and mammalian receptors that may potentially be found at the site (see Section 3.1.3.4 for details). Chemicals with observed concentrations exceeding the EcoRPGs are carried forward to Step 4 (Weight of Evidence Evaluation)
- Step 4 – Weight of Evidence Evaluation: This evaluation looks at multiple lines of qualitative and quantitative evidence to place the potential risks into context of site-specific conditions. These lines of evidence include the results from Steps 1 through 3, comparisons to regional background concentrations, potential for ecological receptors to use the site, available habitat, and expected future use of the site. The results of the evaluation are used to inform risk managers of chemicals considered to pose a potential risk to ecological receptors so that remedial decisions can be made for the site.

The streamlined ERA was conducted under the following assumptions and constraints. These are typical for ERAs performed for both public and private entities:

- Evaluation of current exposures is derived from existing conditions.
- Soils are the abiotic medium of primary ecological concern. Groundwater is considered a minor medium of potential concern, but it is evaluated as it may be encountered within 4 feet of ground surface.
- Measured chemical concentrations are assumed to be at steady-state levels.
- Chemicals never detected or not analyzed for in soil or groundwater samples are not evaluated.
- Each chemical measured in collected samples is considered to have similar bioavailability as the chemical form used in the toxicity studies that are used to estimate potential for risk.
- Toxicological information used represents information currently available from literature and database searches.

3.3.1 Ecological Conceptual Site Model

The ecological conceptual site model combines information on potential sources of contaminants, ecological exposure pathways, and potential ecological receptors to provide an overall picture of site-related exposures and to focus the evaluation of chemical constituents in this streamlined ERA.

The known site history of the site, physical setting, and biological resources are presented in the Oregon SIWP (Jacobs 2021a) along with the potential future uses of the site and potential exposure pathways.

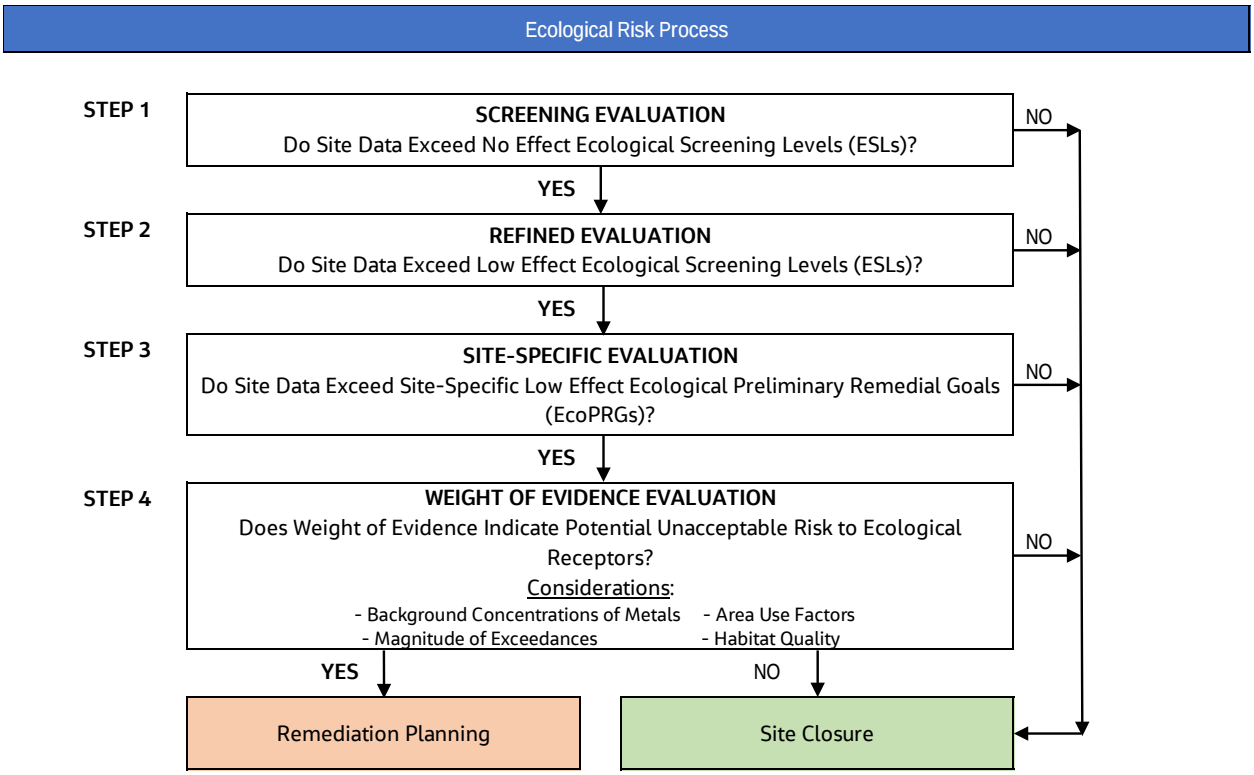

Figure 3-1. Ecological Risk Assessment Process

Potential contaminants include metals, dioxin/furans, SVOCs, and VOCs. The primary impacted media are soils. Release and transport mechanisms may include erosion and surface runoff; infiltration and leaching to groundwater; volatilization, weathering, and/or erosion into soil vapor and ambient air.

Based on review of existing information, the following exposure pathways are considered potentially complete and are evaluated quantitatively under current or potential future land uses.

- Potential exposure to soil from 0 to 1 foot bgs is considered a potentially complete exposure pathway for terrestrial receptors, including terrestrial plants, soil invertebrates, birds, and mammals.
- Potential exposure to soil from 0 foot to 6 feet bgs is considered a potentially complete exposure pathway for burrowing wildlife.
- Potential exposure to onsite groundwater is considered potentially complete as depth to groundwater is less than 4 feet bgs at some locations. Potentially exposed receptors may include deeper rooted plants or birds and mammal if there is potential for the groundwater to reach the surface. Even though the potential for exposure by aquatic organisms is considered very low, this pathway was evaluated.

Receptor groups that have the potential for exposure at the site include terrestrial plants, soil invertebrates, birds and mammals, and aquatic organisms (plants, invertebrates). For purposes of the streamlined ERA, the site is evaluated as a single exposure area. Implicit in the exposure area concept is the assumption that the receptor has equal likelihood of exposure to contamination at any individual location within the identified exposure area.

Site data evaluated for potential risks to ecological receptors are provided in Appendix F. Data evaluated consist of soils (0 foot to 6 feet bgs) and groundwater data collected in 2022 that met data validation requirements including both native and field duplicates. All evaluations in the streamlined ERA are completed on a sample-by-sample basis.

3.3.2 Step 1 – Screening Evaluation

The Screening Evaluation is a very conservative estimate of potential risks. The exposure assumptions are the most conservative because risk estimates are completed on a sample-by-sample basis, it is assumed that ecological receptors spend 100 percent of their time (area use factor [AUF] of 1) at that location, and comparison against the most conservative (i.e., lowest) toxicity criteria as well as regional background concentrations.

The ESLs used in the screening evaluation are based on no effect levels, are intended to be protective of all ecological receptors exposed to soil, and are widely accepted values available from agencies or peer-reviewed literature sources. No Effect ESLs used in the Screening Evaluation (Step 1) were selected from the following sources in hierarchical order.

1) ODEQ Table 1a Risk-Based Concentrations for Plants, Invertebrates, and Wildlife Exposed to Soil (ODEQ 2020)
2) ODEQ Table 1b Risk-Based Concentrations for Wildlife Ingestion of Surface Water (ODEQ 2020)
3) ODEQ Table 2 Risk-Based Concentrations for Aquatic Life (ODEQ 2021)
4) EPA ecological soil screening levels (EcoSSLs) (EPA 2008)
5) Los Alamos National Laboratory (LANL 2020)
6) EPA Region 4 soil screening values (EPA 2018)
7) No effect levels for plants exposed to solutions (Efroymson et al. 1997)

For the sources listed above that include ESLs for plants, soil invertebrates, birds, and mammals, the most conservative (i.e., lowest) ESL from among these terrestrial receptor groups is selected from that source where it appears in the overall hierarchy. The selected No Effect ESLs are summarized in Appendix F, Table F-1 for detected analytes in soil and Appendix F, Table F-2 for detected analytes in groundwater.

Analytes were retained for further evaluation in the Refined Evaluation (Step 2) if at least one detected concentration exceeded the No Effect ESL. In addition, all analytes retained for further evaluation in Step 2 are also included in the Weight of Evidence Evaluation (Step 4). Because of the conservative assumptions used in this analysis, if the detected concentration does not exceed the No Effect ESL, there is a high degree of confidence that the risks to ecological receptors are acceptable.

3.3.3 Step 2 – Refined Evaluation

The Refined Evaluation provides additional information on potential risks for ecological receptors. The refined evaluation remains an overly conservative evaluation because it is still conducted on a sample-by-

sample basis assuming 100 percent site use. The only difference from the Step 1 Screening Evaluation is that a Low Effect ESL is used instead of the No Effect ESL.

The Low Effect ESLs for soil exposures are limited to birds and mammals because risk management decisions are made on these receptor groups. Low Effect ESLs for soil are based on LOAELs for plants and wildlife and are indicative of a level above which potential adverse effects may be observed in some local populations of wildlife (birds and mammals). The soil Low Effect ESLs for wildlife were obtained from LANL (2020) and are generally the most conservative value between birds and mammals across all feeding guilds including herbivores, insectivores, omnivores, and carnivores. The Low Effect ESLs for soil exposures are presented in Appendix F, Table F-1.

Low Effect ESLs for groundwater exposures include acute RBCs for aquatic life (ODEQ Table 2 values) (ODEQ 2021), low effect levels for plants exposed to solutions (Efroymson et al. 1997), and RBCs for direct ingestion of water for birds and mammals (ODEQ Table 1b values) (ODEQ 2020). The Low Effect ESLs for groundwater exposures are presented in Appendix F, Table F-2.

Analytes with detected concentrations in soil exceeding the Low Effect ESL were retained for further evaluation in Step 3. Analytes with detected concentrations in groundwater exceeding the Low Effect ESL were carried forward to Step 4 (Weight of Evidence Evaluation). Because of the conservative assumptions used in this analysis, if the detected concentration does not exceed the Low Effect RSL, there is a high degree of confidence that the risks to ecological receptors are acceptable. Regardless of the risk conclusion in this step, all analytes evaluated in Step 2 are included in the weight of evidence evaluation (Step 4) so that both qualitative and quantitative information can be considered in the recommendations for risk management.

3.3.4 Step 3 – Site-Specific Evaluation

The Site-Specific Evaluation includes multiple refinements to further evaluate potential risks to terrestrial receptors and reduce uncertainties. Analytes retained after Step 2 were evaluated with one or more of these refinements depending on the analytes and results of previous steps:

- Representative species indicative of the ecological setting around the J.C. Boyle Dispersed Recreation Area – 2 are identified and species-specific life history parameters are used to calculate site-specific EcoPRGs.
- Low Effect EcoPRGs are developed for birds and mammals to provide a range of potential risk estimates.
- Risk estimates are completed in a stepwise manner so that contributions from soil versus diet are more readily observed and exposure pathways that may be driving risk can be identified.
- Species-specific home ranges may be used to calculate an AUF for the site that is then applied to the risk estimate to provide a more realistic estimate of potential exposure.
- Site data for metals are compared to regional BTVs to estimate the potential risk resulting from site activity versus natural background levels.
- All analytes evaluated in Step 3 are carried forward to Step 4 (Weight of Evidence Evaluation).

Specific representative species were not identified in Step 1 or Step 2; instead, all functional groups were evaluated (i.e., terrestrial plants, soil invertebrates, birds, and mammals) together using the most conservative assumptions for all receptors. To evaluate ecological exposure for smaller subsets of wildlife, representative species are selected for the primary functional feeding guilds that may have potentially complete exposure pathways. Consistent with *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (EPA 1997), representative

species are preferably those that have ecological relevance, are of societal value, and are susceptible to chemical stressors at the site. These factors were used to select representative species that have been observed or are expected to occur at the site and meet one or more of the following criteria:

- Receptor occurs in the general area and habitat is available onsite to support the receptor.
- Receptor has a small home range.
- Receptor is representative of a feeding guild.

Representative species identified for the site include the following:

- Herbivores: Mourning dove (*Zenaida macroura*), deer mouse (*Peromyscus maniculatus*)
- Invertivore: Hermit thrush (*Catharus guttatus*), vagrant shrew (*Sorex vagrans*)
- Carnivores: Red-tailed hawk (*Buteo jamaicensis*), coyote (*Canis latrans*)

3.3.4.1 Derivation of Site-Specific EcoPRGs

EcoPRGs are species specific RBCs of chemicals in soil that correspond to reported effect levels for a given species and are reported in milligrams per kilogram (mg/kg). The EcoPRGs were derived for each of the selected representative species using a food-chain uptake model that accounts for the transfer of chemicals to upper trophic levels (birds and mammals) through the incidental ingestion of soil and ingestion of food (forage or prey) that has accumulated chemicals from the site. The derivation model for EcoPRGs follows the generalized food chain uptake model from Suter et al. (2000) and is shown below. The major inputs to the equation are described following the derivation model and include toxicity reference values (TRVs), food ingestion rates (FIR), dietary composition (Pi), and proportion of diet that is soil (Ps). Supporting tables and calculations are included in Appendix F.

$$EcoPRG = \frac{TRV}{[Ps \bullet FIR] + [\sum_{i=1}^{N} Bi \bullet Pi \bullet FIR]}$$

$$Where:$$
$$B_i = [Soil] \bullet BAF$$

Where:

EcoPRG	=	ecological preliminary remedial goal in soil (mg/kg)
TRV	=	no effect or low effect toxicity reference value (mg/kg body weight per day)
P_s	=	proportion of diet that is soil (unitless)
FIR	=	food ingestion rate normalized to body weight (kg/kg body weight per day)
B_i	=	concentration of chemical in biota type (i) (mg/kg)
P_i	=	proportion of diet that is biota type (i)
BAF	=	bioaccumulation factor (dry weight)
[Soil]	=	concentration of the analyte in soil

Toxicity Reference Values (TRVs) – TRVs for birds and mammals are represented as a dosage (the amount of an analyte per unit body weight per day) that has been reported to result in an adverse effect. The TRVs for birds and mammals were selected using the following hierarchy of sources and are presented in Appendix F, Table F-3 (birds) and Table F-4 (mammals) for chemicals retained for further evaluation in the site-specific evaluation:

1. Recommended no observed adverse effect level (NOAEL) TRVs and derived LOAEL-based TRVs from the EPA EcoSSL documentation (EPA 2005a, 2005b, 2005c; EPA 2007b, 2007c, 2007d, 2007e)
2. Toxicological benchmarks for wildlife (Sample et al. 1996)

3. NOAEL and LOAEL TRVs from LANL (2020)
4. Other peer-reviewed literature (cited as appropriate)

TRVs are classified into two categories: No Effect TRVs and Low Effect TRVs. The No Effect TRVs are based on the chronic NOAEL and reflect the highest exposure that has been demonstrated to exert no adverse effect. The Low Effect TRVs are based on the chronic LOAEL and reflect exposure that has been demonstrated to exert an adverse effect.

For analytes with information in EPAs EcoSSL documentation (source in item 1 above), the NOAEL TRV that was used to derive the final EcoSSL was selected if it had the highest level of confidence over other available values. In addition, LOAEL toxicity results for growth and reproduction studies were used to derive a geometric mean LOAEL TRV.

For analytes without EPA EcoSSLs (source in item 1 above), appropriate toxicity studies from peer-reviewed literature were selected based on several criteria. Specifically, toxicity studies were selected for use if exposure was chronic or during reproduction (a critical life stage), the dosing regime was sufficient to identify both a NOAEL and a LOAEL, and the study considered ecologically relevant effects (for example, growth or reproduction). Literature-derived TRVs are adjusted through use of uncertainty factors (where applicable) to derive a final chronic No Effect TRV and chronic Low Effect TRV.

Receptor Exposure Factors – Species-specific life history factors are used to estimate the exposure to chemicals for each of the representative species selected for the site. These include body weight; food ingestion rate (FIR); proportions of the receptors diet (P_i) composed of plants, invertebrates, or mammals; and fraction of diet composed of incidental soil ingestion (P_s). Exposure factors and allometric equations to estimate FIRs were obtained from the literature.

Bioaccumulation Factors (BAFs) – The measurement or estimation of concentrations of chemicals in wildlife food is necessary to evaluate how much of a receptor's exposure is through food versus direct uptake of contaminated media. Although the preferred data are direct measurements of concentrations in biota samples collected from the site, such data were not available for the Project. Therefore, literature-reported values or uptake models are used to estimate bioaccumulation. BAFs and regression models were obtained from the EcoSSL documentation (EPA 2007a), Sample et al. (1998), LANL (2020), and Baes et al. (1984). A default BAF of 1 was used in the absence of reliable values. BAFs and regression models for analytes retained for further evaluation in the site-specific evaluation are presented in Appendix F, Table F-5.

EcoPRGs – No Effect EcoPRGs and Low Effect PRGs were developed for those analytes that had exceedances of the Low Effect RSL in Step 2 and are presented in Appendix F, Table F-6. The most conservative EcoPRG for birds and the most conservative EcoPRG for mammals were used to estimate potential risks in the site-specific evaluation and are shown in the screening-level summary table (Appendix F, Table F-1).

3.3.4.2 Site-Specific Risk Estimation

The site-specific risk estimates were calculated using the No Effect and Low Effect EcoPRGs as follows:

$$HQ = \frac{[Soil]}{EcoPRG} \; x \; AUF$$

Where:

HQ = hazard quotient (unitless)
[Soil] = sample-specific concentration of analyte in soil (mg/kg)
EcoPRG = ecological preliminary remedial goal in soil (mg/kg)
AUF = area use factor

EcoPRG – The most conservative bird and mammalian No Effect EcoPRG or Low Effect EcoPRG. All EcoPRGs are presented in Appendix F, Table F-6 and the most conservative values that are used in the risk estimation are summarized in Appendix F, Table F-1.

Area Use Factors – Many wildlife species are highly mobile, covering relatively large areas in search of food, water, and shelter. As such, the exposure that individual receptors experience depends on the amount of time they spend in the exposure area. The species-specific AUF is calculated by dividing the exposure area (acres) by the foraging range (acres) of the receptor. If the foraging range is smaller than the exposure area, the AUF defaults to 1. The AUFs for each receptor for the site are presented in Appendix F, Table F-7.

The site-specific risk estimates were calculated using the Low Effect EcoPRGs and AUFs for hermit thrush and vagrant shrew as these were the receptors with the most conservative EcoPRGs for the analytes retained for further evaluation in Step 3. The risk estimates were completed both with and without the application of the receptor/site-specific AUFs.

3.3.5 Step 4 – Weight of Evidence Evaluation

Not all the site risk estimates with HQs exceeding 1 are ultimately ecologically meaningful. The weight of evidence component (Step 4 of the streamlined ERA) is an evaluation of the lines of evidence supporting or refuting the risk estimates and an interpretation of the significance of the adverse effects on the identified assessment endpoints. To provide confidence in any decision making regarding risk to ecological resources at a site, potential effects to ecological receptor is assessed using an approach that considers multiple lines of evidence collectively, in accordance with EPA guidance in *Guidelines for Ecological Risk Assessment* (EPA 1998).

The following lines of evidence are considered where applicable for each exposure area and exposure media.

- Site risk estimates for soil and groundwater exposures at the No Effect ESL and Low Effect ESL
- Site risk estimates for soil exposures using the No Effect EcoPRG and Low Effect EcoPRG (with and without application of the AUF)
- Comparison of site concentrations of metals to background concentrations
- Area use factors for wildlife
- Current and potential future land use and habitat quality
- Potential receptors/presence of federal or state threatened and endangered species
- Uncertainties and limitations

Results of Step 4 are used to provide recommendations for risk management or no further evaluation for ecological receptors. The results of Step 4 are summarized in in tabular format for soil and groundwater exposure pathways. Each chemical that was retained after Step 1 is presented in the respective summary table along with a listing of the number of samples exceeding the No Effect ESL, Low Effect RSL, bird EcoPRG, mammal EcoPRG, and background concentrations. The weight of evidence is summarized into a

letter code for all chemicals with the same rationale to reduce redundancy in the text. The codes focus primarily on the quantitative elements however, the qualitative lines of evidence are also considered and are discussed as needed where they impact the final recommendation. Uncertainties and limitations that are standard in the practice of risk assessment are summarized in Appendix F, Table F-8.

4. J.C. Boyle Dispersed Recreation Area – 2

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the J.C. Boyle Dispersed Recreation Area – 2 site. A data quality evaluation was performed on the analytical laboratory results (Appendix C), and the conclusions of that evaluation are provided in Appendix D.

4.1 Background

A burn pit, surrounded by stressed vegetation and located on the north bank of the J.C. Boyle Reservoir approximately 0.4 mile east of Spencer Creek, was documented in the *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020b). A review of the photographs in AECOM (2020b) indicates this is a human-made fire ring that may have been spread out after use (Photograph 4-1). The original fire ring appears to have been 4 or 5 feet in diameter and the disturbed area was approximately 10 feet by 10 feet, containing ash, charred wood, broken glass, and other debris. Soil within the J.C. Boyle Dispersed Recreation Area – 2 site is generally classified as Bly-Royst complex (USDA 2021).

Photograph 4-1. J.C. Boyle Dispersed Recreation Area – 2 looking west at Burn Pit (Jacobs 2021a)

4.2 Field Activities

On May 4, 2022, the three planned soil borings (JBRA-01 to JBRA-03) for the site were marked and cleared for utilities, and the visually impacted areas were delineated with a GPS unit (Figure 4-1).

Soil boring JBRA-02 was moved several feet to the center of the fire pit and soil boring JBRA-03 was moved 10 feet south to the edge of the visually impacted area. The three soil borings were advanced by hand auger to depths of 2.5 or 3.5 feet bgs. Soil samples were collected from discrete intervals at varying depths to the bottom of the boreholes (Table 4-1). Groundwater was observed at a depth of approximately 3.5 feet in soil borings JBRA-02 and JBRA-03. Consequently, a disposable bailer was used to collect a groundwater sample from soil boring JBRA-02.

Table 4-1. J.C. Boyle Dispersed Recreation Area – 2 Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
JBRA-01	0-0.5, 1-1.5, 2-3, 3-3.5	3.5	HA	North edge of fire pit.
JBRA-02	0-0.5, 1-1.5, 3-3.5	3.5	HA	Center of fire pit. Depth to water at 3.5 feet bgs.
JBRA-03	0-0.5, 1-1.5, 1.5-2.5	3.5	HA	South edge of fire pit. Depth to water at 3.5 feet bgs.

Notes:
bgs = below ground surface
HA = hand auger

4.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix C) established in the Oregon SIWP. Human health screening levels were exceeded for antimony, cobalt, and lead at soil boring JBRA-02. Screening levels for leaching to groundwater were exceeded for naphthalene and lead at soil boring JBRA-02. Ecological screening levels were exceeded for dioxins, cobalt, and selenium at all three soil borings, and for antimony, boron, cadmium, copper, lead, and zinc at soil boring JBRA-02. Screening levels for groundwater were exceeded for dioxins and arsenic at soil boring JBRA-02 (Table 4-2, Figure 4-1).

Table 4-2. J.C. Boyle Dispersed Recreation Area – 2 Boreholes with Compounds that Exceed Screening Levels

Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs	Groundwater SLs
JBRA-01	<SLs	<SLs	Dioxins, Cobalt, Selenium	Not Applicable
JBRA-02	Antimony, Cobalt, Lead	Naphthalene, Lead	Dioxins, Antimony, Boron, Cadmium, Cobalt, Copper, Lead, Selenium, Zinc	Dioxins, Arsenic
JBRA-03	<SLs	<SLs	Dioxins, Cobalt, Selenium	Not Applicable

Note:
SLs = screening levels
<SLs = does not exceed screening levels

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

4.4 Site-Specific Human Health Risk Assessment

4.4.1 Data Evaluation

The human health COPCs in soil at the site are antimony, cobalt, and lead (Appendix E). Dioxins and arsenic are the human health COPCs in groundwater (Appendix E).

4.4.2 Exposure Assessment

Default exposure parameters (ODEQ 2017) were used to develop the RBCs in soil and groundwater. Because groundwater was encountered at a depth of 3.5 feet bgs during the site investigation, the shallow groundwater is not considered potable water and potential future exposure to shallow groundwater through drinking water use was not evaluated. Shallow groundwater was evaluated for potential risk to construction and excavation workers through direct contact exposure.

4.4.3 Toxicity Evaluation

Concentrations of dioxins and dioxin-like compounds were evaluated using dioxin toxicity equivalency factors (TEFs) to calculate a 2,3,7,8-Tetrachlorodibenzo-P-dioxin (2,3,7,8-TCDD) toxic equivalent (TEQ) concentration. The RBCs for 2,3,7,8-TCDD were used for the calculated 2,3,7,8-TCDD TEQ concentrations.

4.4.4 Human Health Risk Assessment Results

4.4.4.1 Soil

Concentrations of antimony and cobalt in soil are considered to be naturally occurring (Table 4-3). There are no ODEQ RBCs for these analytes (ODEQ 2018). Therefore, risk from exposure to antimony and cobalt in soil is not considered in this analysis. The EPC of lead in surface soil (970 mg/kg) exceeds the ODEQ RBCs for the residential and construction worker exposure scenarios (400 mg/kg and 800 mg/kg, respectively). Therefore, risk from exposure to lead in surface soil exceeds target risk criteria. The EPC of lead in mixed-zone soil (285.9 mg/kg) is less than the residential and construction worker RBCs.

4.4.4.2 Shallow Groundwater

Concentrations of arsenic (3.7 micrograms per liter [µg/L]) and 2,3,7,8-TCDD TEQ (2.5E-07) in shallow groundwater are less than the ODEQ RBCs (6,300 µg/L and 4.5E-04 µg/L, respectively) for a construction worker who might encounter groundwater (Table 4-4). Therefore, risk from exposure to arsenic and 2,3,7,8-TCDD TEQ in shallow groundwater does not exceed target risk criteria.

4.4.5 Uncertainty Discussion

In general, the numbers and locations of soil and groundwater samples are considered adequate for risk assessment purposes, and the types of COPCs identified are considered representative of potential releases within the site. The EPC of lead in surface soil is the maximum detected concentration (970 mg/kg), which likely overestimates the site risks. The maximum detected concentration is the only sample that exceeds the ODEQ RBCs, and the mean concentration in surface soil is 147 mg/kg, which is below the RBCs. However, the maximum detected concentration was conservatively used as the EPC in surface soil, rather than the mean, to address the lead hot spot.

4.4.6 Human Health Risk Assessment Conclusions

The EPC for lead in soil (maximum detected concentration) exceeds ODEQ RBCs. Although the maximum detected concentration is the only result greater than the residential and construction worker ODEQ RBCs, lead is considered a contaminant of concern in soil.

4.5 Leaching to Groundwater Evaluation

The soil leaching COPCs at the site are lead and naphthalene (Table 4-5, Appendix E). Groundwater was encountered at 3.5 feet bgs during the site investigation. The J.C. Boyle Reservoir on the Klamath River is located approximately 30 feet south of the site and has a water surface elevation that is approximately 3 to 4 feet lower than this site.

4.5.1 Lead

Lead was detected at concentrations exceeding the soil leaching RBC of 34 mg/kg in two of 10 samples (JBRA-02 at 970 mg/kg at 0 to 0.5 foot bgs and at 64 mg/kg at 3 to 3.5 feet bgs). Lead did not exceed the soil leaching RBC in samples collected at locations JBRA-01 and JBRA-03. Lead was also detected in shallow groundwater at a concentration of 12 J µg/L (where "J" indicates an estimated value). Therefore, the migration to groundwater pathway is considered complete and concentrations of lead in soil pose a potential threat to groundwater.

4.5.2 Naphthalene

Naphthalene was detected at a concentration exceeding the soil leaching RBC of 0.077 mg/kg in only 1 of 10 samples (JBRA-02 at an estimated 0.29 mg/kg from 0 to 0.5 foot bgs). Naphthalene did not exceed the soil leaching RBC in deeper soil samples collected at 1 foot to 1.5 feet bgs and 3 to 3.5 feet bgs at JBRA-02, indicating leaching is not occurring. Naphthalene did not exceed the soil leaching RBC in samples collected at locations JBRA-01 and JBRA-03. In addition, naphthalene was not detected in shallow groundwater. Therefore, the migration to groundwater pathway is considered incomplete.

4.5.3 Leaching to Groundwater Evaluation Conclusions

Concentrations of lead exceed soil leaching RBCs at location JBRA-02 and could potentially migrate to groundwater.

4.6 Ecological Risk Assessment

The streamlined ERA completed for the site was conducted on a sample-by-sample basis for soil and groundwater and the results are summarized in the following subsections.

4.6.1 Soil Exposure Pathways

Potential risks to terrestrial ecological receptors exposed to chemicals in soil were evaluated on a sample-specific basis. Risk estimates are presented in Appendix F, Table F-9. The results are summarized in Table 4-6.

Several metals, dioxins, and SVOCs exceeded their respective No Effect ESLs (Step 1). Metals and 2,3,7,8-TCDD TEQ mammal also exceeded their Low Effect ESLs (Step 2). Lead, vanadium, and zinc exceeded the bird EcoPRG and boron exceeded the mammal EcoPRG. However, all AUF-adjusted HQs were less than 1. There were no analytes in soils retained for risk management based on potential risks to ecological receptors. The weight of evidence rationale for each analyte is summarized as follows:

- Weight of Evidence Code "A" – Chemical is not retained for risk management for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. In addition, there were no exceedances of the BTV for metals. This weight of evidence code applies to the following:
  - Metals: arsenic, barium, chromium, cobalt, manganese, and thallium
  - Dioxins: 2,3,7,8-TCDD TEQ Bird
  - Semivolatile Organics: bis (2-ethylhexyl) phthalate
- Weight of Evidence Code "B" – Chemical is not retained for risk management for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. This weight of evidence rationale applies to cadmium.
- Weight of Evidence Code "C" – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL, however none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use). This weight of evidence rationale applies to the following analytes.
  - Metals: antimony, copper, nickel, and selenium
  - Dioxins: 2,3,7,8-TCDD TEQ Mammal
- Weight of Evidence Code "D" – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird or Mammal EcoPRG assuming 100 percent site use, however there were no exceedances of the AUF-adjusted EcoPRGs and there were no exceedances of the BTVs. This weight of evidence rationale applies to boron and vanadium.
- Weight of Evidence Code "E" – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird or Mammal EcoPRG assuming 100 percent site use; however, there were no exceedances of the AUF-adjusted EcoPRGs and there were no exceedances of the BTVs. This weight of evidence rationale applies lead and zinc.

4.6.2 Groundwater Exposure Pathways

Depth to groundwater at the site is less than 4 feet bgs. The only direct exposure pathway to groundwater is root uptake by deeper rooted plants. In the unlikely event that groundwater reaches the surface, then potential exposure pathways would include direct contact by aquatic organisms (aquatic plants and invertebrates), root uptake by shallow-rooted terrestrial plants, and direct ingestion by birds and mammals. Sample-specific risk estimates for Step 1 (No Effect ESLs) and Step 2 (Low Effect ESLs) are presented in Appendix F, Table F-10. The overall results and weight of evidence are presented in Table 4-7 and summarized as follows:

- Weight of Evidence Code "A" – Chemical is not retained for risk management for ecological receptors. Individual sample results exceeded the Chronic Aquatic Life benchmarks. However, none of the samples exceeded the Acute Aquatic Life benchmark, the No Effect ESLs for Plants and Wildlife, or the Low Effect ESLs for Plants and Wildlife. This weight of evidence rationale applies to the following:
  - Metals – cadmium, lead, manganese, vanadium, and zinc
  - Dioxins – 2,3,7,8-TCDD TEQ Bird and 2,3,7,8-TCDD TEQ Mammal
- Weight of Evidence Code "B" – Chemical is not retained for risk management for ecological receptors. Individual results from one sample exceeded the Chronic and Acute Aquatic Life benchmarks. However, neither sample exceeded the No Effect or Low Effect ESLs for Plant or Wildlife. This weight of evidence rationale applies to copper.

- Weight of Evidence Code "C" – Chemical is not retained for risk management for ecological receptors. Individual results from one sample exceeded the Chronic Aquatic Life benchmark, the No Effect ESL for Plants, or both. However, none of the detected samples exceeded the Acute Aquatic Life benchmarks or the Low Effect ESLs Plants or Wildlife. This weight of evidence rationale applies to arsenic and iron.

4.7 Recommended Actions

Human health risk in shallow groundwater does not exceed target risk criteria, but concentrations of lead in soil exceed the ODEQ target RBCs. Concentrations of lead exceed the leaching to groundwater RBC for soil at boring JBRA-02. The ERA indicated that potential risks to ecological receptors from soil or groundwater exposure pathways are limited. No chemicals were retained for risk management purposes for ecological receptors.

It is recommended that the visually impacted soil at the site be excavated to a depth of 4 feet bgs or to groundwater, whichever is encountered first (Figure 4-2). Soil samples will be collected from the floor and sidewalls of the excavation to confirm that lead concentrations do not exceed background concentrations (34 mg/kg).

J.C. Boyle Dispersed Recreation Area 2	SVOC	Bis (2-ethylhexyl) phthalate	--	2	--	--	--	--	--	No	A

Notes:
Number presented under each step identifes the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.
-- = No samples had exceedances; analyte not retained for further evaluation
2,3,7,8-TCDD TEQ = 2,3,7,8-Tetrachlorodibenzo-P-dioxin toxic equivalent
AUF = area use factor
bgs = below ground surface
BTV = background threshold value
DXN = dioxin, furan
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient
REC = recognized environmental condition
SVOC = semivolatile organic compound

Weight of Evidence Rationale Codes:

A = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. In addition, there were no exceedances of the BTV (metals).

B = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals.

C = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use).

D = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird or Mammal EcoPRG assuming 100 percent site use; however, there were no exceedances of the AUF-adjusted EcoPRGs and there were no exceedances of the BTVs.

E = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird or Mammal EcoPRG assuming 100 percent site use; however, there were no exceedances of the AUF-adjusted EcoPRGs and there were no exceedances of the BTVs.

Table 4-7. Weight of Evidence for Ecological Receptors at J.C. Boyle Dispersed Recreation Area – 2: Groundwater Exposure Pathways

			Step 1			Step 2			Step 4	
			Screening Evaluation			Refined Evaluation			Weight of Evidence	
REC Name	Class	Detected Analytes	Chronic Aquatic HQ>1	No Effect Plant HQ>1	No Effect Wildlife HQ>1	Acute Aquatic HQ>1	Low Effect Plant HQ>1	Low Effect Wildlife HQ>1	Retain for Risk Management?	Rationale
J.C. Boyle Dispersed Recreation Area 2	Metal	Arsenic	--	2	--	--	--	--	No	C
J.C. Boyle Dispersed Recreation Area 2	Metal	Cadmium	2	--	--	--	--	--	No	A

J.C. Boyle Dispersed Recreation Area 2	Metal	Vanadium	2	--	--	--	--	--	No	A
J.C. Boyle Dispersed Recreation Area 2	Metal	Zinc	2	--	--	--	--	--	No	A
J.C. Boyle Dispersed Recreation Area 2	DXN	2,3,7,8-TCDD TEQ Bird	1	--	--	--	--	--	No	A
J.C. Boyle Dispersed Recreation Area 2	DXN	2,3,7,8-TCDD TEQ Mammal	1	--	--	--	--	--	No	A

Notes:

Number presented under each step identifies the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.

-- = No samples had exceedances; analyte not retained for further evaluation.

2,3,7,8-TCDD TEQ = 2,3,7,8-Tetrachlorodibenzo-P-dioxin toxic equivalent

bgs = below ground surface

DXN = dioxin, furan

EcoPRG = ecological preliminary remedial goal

ESL = ecological screening level

HQ = hazard quotient

REC = recognized environmental condition

REC = recognized environmental condition

Weight of Evidence Rationale Codes:

A = Chemical is not retained for risk management analysis for ecological receptors. Individual sample results exceeded the Chronic Aquatic Life benchmarks. However, none of the samples exceeded the Acute Aquatic Life benchmark, the No Effect ESLs for Plants and Wildlife, or the Low Effect ESLs for Plants and Wildlife.

B = Chemical is not retained for risk management analysis for ecological receptors. Individual sample results from one well exceeded the Chronic and Acute Aquatic Life benchmarks. However, neither sample exceeded the No Effect or Low Effect ESLs for Plant or Wildlife.

C = Chemical is not retained for risk management analysis for ecological receptors. Individual sample results from one well exceeded the Chronic Aquatic Life benchmark and/or the No Effect ESL for Plants. However, none of the detected samples exceeded the Acute Aquatic Life benchmarks or the Low Effect ESLs Plants or Wildlife.

5. Summary of Recommendations

This section summarizes the recommendations for further action at the J.C. Boyle Dispersed Recreation Area – 2, which was assessed according to the Oregon SIWP in May 2022.

Based on the analytical results and the results of the risk assessments, it is recommended that site soil and burnt materials be removed. PacifiCorp will prepare a removal action plan for excavation and offsite disposal of visually impacted soil and burnt material within the immediate vicinity of the burn pit and to a depth of 4 feet bgs or groundwater, whichever is encountered first (Figure 4-2). The removal action plan will, at a minimum, address proper excavation techniques, confirmation sampling for excavation floors and sidewalls, waste management and disposal of soil, and backfill and compaction requirements. Soil samples will be collected to confirm that lead concentrations do not exceed the background concentration for lead (34 mg/kg).

A soil removal action and closeout report will be prepared upon completion of the removal actions. The report will contain a summary of the remedial activities performed, waste manifests that document proper transport and disposal of excavated soil, and tables and figures of the analytical results from confirmation sampling for the contaminants of concern at each site.

Notes:
-- = Not analyzed
CAS = Chemical Abstracts Service
FD = field duplicate sample
J = Estimated value less than reporting limit but greater than method detection limit or value is estimated due to a sampling or laboratory quality control issue
mg/kg = milligram(s) per kilogram
N = normal sample
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit
UJ = The analyte was below the reported sample quantitation limit; however, the reported value is approximate

Bold indicates the analyte was detected
Shading indicates the result exceeded screening criteria

Notes:
-- = Not analyzed
CAS = Chemical Abstracts Service
FD = field duplicate sample
J = Estimated value less than reporting limit but greater than method detection limit or value is estimated due to a sampling or laboratory quality control issue
µg/L = microgram(s) per liter
N = normal sample
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit
UJ = The analyte was below the reported sample quantitation limit; however, the reported value is approximate

Bold indicates the analyte was detected
Shading indicates the result exceeded screening criteria

VOC	volatile organic compound

1. Introduction

The objective of this data quality evaluation (DQE) report is to assess the data quality of analytical results for water and soil samples collected by Jacobs Engineering Group Inc. (Jacobs) on behalf of PacifiCorp during investigation of pre-existing environmental conditions for the Lower Klamath Hydroelectric Project (Project). The Project is divided between sites in California and Oregon. Jacobs and PacifiCorp have prepared separate Site Investigation Work Plans (SIWPs) for the sites in California and Oregon (Jacobs 2021a and 2021b) and a sampling and analysis plan (Appendix A to the California and Oregon SIWPs). Jacobs is currently preparing a site investigation report for the sites in each state to meet Project-specific requirements.

The individual method requirements and guidelines from the U.S. Environmental Protection Agency (EPA) *National Functional Guidelines for Organic Superfund Methods Data Review* (EPA 2020a) and the EPA *National Functional Guidelines for Inorganic Superfund Methods Data Review* (EPA 2020b) were consulted for this evaluation. This DQE report provides a general data quality assessment and a summary of data issues.

2. Analytical Data

This DQE report covers 17 normal water and 308 normal soil samples, 5 water and 30 soil field duplicates (FDs), 16 equipment blanks (EBs), and 21 trip blanks (TBs) for a total of 39,378 individual sample results. Samples were collected between March 8 and May 14, 2022. A list of samples and collection dates is attached to this report. These sample results were reported under 38 sample delivery groups (Table 1). The analyses were performed by Eurofins Calscience Laboratory (EUCG) in Garden Grove, California, Eurofins Lancaster Laboratory (LANC) in Lancaster, Pennsylvania, Eurofins TestAmerica Seattle (TAM2) in Tacoma, Washington, and Eurofins TestAmerica West Sac (TAMC) in West Sacramento, California.

Table 1. Sample Delivery Groups

580-111242-1	580-111242-3	580-111291-1	580-111291-3
580-111310-1	580-111310-4	580-111378-1	580-111378-5
580-111908-1	580-113389-1	580-113389-2	580-113389-3
580-113389-4	580-113448-1	580-113448-2	580-113501-1
580-113501-2	580-113501-3	580-113534-1	580-113534-2
580-113673-1	580-113673-2	580-113717-1	580-113720-1
580-113720-2	580-113785-1	580-113785-2	580-113790-1
580-113790-2	580-113802-1	580-113809-1	580-113809-2
580-113851-1	580-113851-2	580-113862-1	580-113862-2
580-113864-1	580-113864-2		

Samples were collected and delivered by courier to the laboratories for analysis. Samples were analyzed by the laboratories listed above for the one or more of the parameters/methods presented in the California or Oregon SIWPs (Table 2).

Table 2. Analytical Parameters

Parameter	Method	Laboratory
TPH as Gasoline Range Organics	CALUFTMS/SW8015B-P	TAM2; LANC
Metals	SW6010B/SW6020	TAM2
Metals (STLC Leachate)	SW6010B-STLC	TAMC
Metals (TCLP Leachate)	SW1311/SW6010B	TAM2
Mercury	SW7470A/SW7471A	TAM2
Mercury (STLC Leachate)	SW7470A-STLC	TAMC
Ethylene Dibromide/Dibromochloropropane	SW8011	TAM2
TPH as Diesel Range Organics/Extended Range Organics	SW8015B-E	TAM2
Polychlorinated Biphenyls	SW8082	TAM2
Volatile Organic Compounds	SW8260B	TAM2
Volatile Organic Compounds (STLC Leachate)	SW8260B-STLC	EUCG
Semivolatile Organic Compounds	SW8270C	TAM2
Semivolatile Organic Compounds (STLC Leachate)	SW8270C-STLC	TAMC
Polycyclic Aromatic Hydrocarbons	SW8270SIM	TAM2
Dioxins/Furans	SW8290	TAMC

Notes:

Parameters

STLC = Soluble Threshold Limit Concentration

TPH = total petroleum hydrocarbons

TCLP = toxicity characteristic leaching procedure

Laboratories

EUCG = Eurofins Calscience Laboratory

LANC = Eurofins Lancastor Laboratory

TAM2 = Eurofins TestAmerica Seattle

TAMC = Eurofins TestAmerica West Sac

The assessment of data includes a review of: (1) the chain-of-custody documentation; (2) holding-time compliance; (3) the required field and laboratory quality control (QC) samples; (4) method blanks; (5) laboratory control samples (LCS); (6) surrogate spike recoveries; (7) matrix spike/matrix spike duplicate (MS/MSD) samples; (8) analytical spike data (for example, post-digestion spikes for metals analyses); (9) initial and continuing calibration information; and (10) other method-specific criteria.

Field samples were also reviewed to ascertain field compliance and data quality issues. This included the review of FDs, EBs, and TBs.

Data flags were assigned according to QC acceptance limits. These flags, as well as the reason for each flag, are entered into the electronic database. Multiple flags are routinely applied to specific sample method/matrix/analyte combinations, but there will be only one final flag. A final flag is applied to the data and is the most conservative of the applied validation flags. The final flag also includes blank sample impacts.

The data flags are defined from most conservative to least as follows:

- R = The result was unusable due to deficiencies in the ability to analyze the sample and meet QC criteria.
- J = Analyte was present but the reported value may not be accurate or precise (estimated). The result was estimated due to either being less than the referenced reporting limit but greater than the method detection limit or due to a QC exceedance.
- UJ = Analyte was not detected and the specified detection limit may not be accurate or precise (estimated).
- U = Analyte was not detected at the specified detection limit.

3. Findings

The overall summaries of the data validation findings are contained in the following sections. Qualified data are presented in Table 3.

3.1 Holding Times

All holding-time criteria were met, with the following exceptions:

- The holding time for the STLC leachate of mercury by method SW7470A was exceeded by 15 to 17 days for 22 soil samples. Samples were received by the secondary laboratory after holding time had been exceeded. Analysis was also performed by laboratory on a precautionary basis due to lab capacity issues. After review of the final results for total mercury, the analysis of method SW7470A-STLC was not required. Because hold times had been exceeded, one detected sample result was qualified as an estimated value and flagged "J" and 21 nondetected sample results were qualified as estimated values and flagged "UJ."
- The holding time for 1,2,3-trichloropropane, 1,2-dibromo-3-chloropropane, and ethylene dibromide by method SW8011 was exceeded by 1 to 14 days for one groundwater sample and 112 soil samples because of a laboratory error. The laboratory utilized a holding time of 14 days from sample collection to extraction, then 40 days from extraction to analysis while the methodology recommends using a 14-day holding time from sample collection to analysis like other volatile organic compound (VOC) methods (for example, SW8260B). The data were evaluated based on SW8011 methodology recommendation. Seven detected sample results were qualified as estimated and flagged "J;" 326 nondetected sample results were qualified as estimated and flagged "UJ." One sample was analyzed more than 14 days past the holding time. The associated three sample results were nondetect and were rejected from project use and flagged "R."
- The sample preparation holding time for TPH as Diesel Range Organics/Extended Range Organics by method SW8015B-E was exceeded by 13 to 15 days for two soil samples. Samples were released from hold after the holding time had been exceeded. Three detected sample results were qualified as estimated and flagged "J;" one nondetected sample result was qualified as estimated and flagged "UJ." One water sample was reprepared 2 days past the sample preparation holding because of a laboratory QC exceedance in the original sample batch. One detected sample result was qualified as estimated and flagged "J."
- The sample preparation holding time for benzoic acid by method SW8270C was exceeded by 3 days for 13 soil samples. The samples were reprepared outside holding time because of laboratory QC exceedances in the original sample batch. A total of 13 nondetected sample results were qualified as estimated and flagged "UJ."

- The holding time for the STLC leachate of semivolatile organic compounds (SVOC) by method SW8270C-STLC was exceeded by 4 days for 4 soil samples. Analysis was performed by laboratory on a precautionary basis because of lab capacity issues. SW8270C-STLC analysis was only required for two of the four samples due to pentachlorophenol exceeding STLC limits in the original SW8270C analysis. A total of 264 nondetected sample results were qualified as estimated and flagged "UJ."
- The sample preparation holding time for polycyclic aromatic hydrocarbons (PAH) by method SW8270SIM was exceeded by 6 days for one soil sample, and 2 days for two water samples. The samples were reprepared outside holding time because of laboratory QC exceedances in the original sample batch. A total of 54 nondetected sample results were qualified as estimated and flagged "UJ."
- The sample preparation holding time for dioxins/furans by method SW8290 was exceeded by 1 day for two soil samples because of a laboratory error. A total of 12 detected sample results were qualified as estimated and flagged "J;" 22 nondetected sample results were qualified as estimated and flagged "UJ."

3.2 Calibration

Initial and continuing calibration criteria were met, with the following exceptions:

- Acetone or vinyl acetate in the initial calibration verification standard by method SW8260B were either less than or greater than the acceptance criteria. Two detected sample results were qualified as estimated and flagged "J;" six nondetected sample results were qualified as estimated and flagged "UJ."
- Benzo(a)pyrene in the initial calibration verification standard by method SW8270C was either less than or greater than the acceptance criteria. A total of 14 detected sample results were qualified as estimated and flagged "J;" 20 nondetected sample results were qualified as estimated and flagged "UJ."
- Several VOCs in one or more continuing calibration verification standards by method SW8260B were either less than or greater than the acceptance criteria. A total of 10 detected sample results were qualified as estimated and flagged "J;" 60 nondetected sample results were qualified as estimated and flagged "UJ."
- Several SVOCs in one or more continuing calibration verification standards by method SW8270C were either less than or greater than the acceptance criteria. Three detected sample results were qualified as estimated and flagged "J;" 79 nondetected sample results were qualified as estimated and flagged "UJ."

3.3 Method Blanks

Method blanks were analyzed at the required frequency and were free of contamination that would affect the sample results with the following exceptions:

- Boron was detected less than the reporting limit in three method blanks for method SW6010B. A total of 18 associated results less than five times the blank concentrations were qualified as not detected (EPA 2020b) and flagged "U."
- Beryllium, chromium, copper, selenium, silver, or zinc were detected less than the reporting limit in three method blanks for method SW6010B-STLC. A total of 44 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Several VOCs were detected less than the reporting limit in three method blanks for method SW8260B. A total of 36 associated results less than five times the blank concentrations were qualified as not detected (EPA 2020a) and flagged "U."

- Several SVOCs were detected less than the reporting limit in 12 method blanks for method SW8270C. A total of 223 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Fluorene was detected less than the reporting limit in one method blank for method SW8270SIM. Two associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Dioxins/furans were detected less than the reporting limit in 11 method blanks for method SW8290. A total of 311 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."

3.4 Field Blanks

Field blanks consist of Equipment Blanks (EBs) collected to evaluate the potential for contamination from equipment between sites and Travel Blanks (TBs) included in sample shipping containers to evaluate contamination during transit. A total of 16 EBs and 20 TBs were collected and analyzed and were free of contamination that would affect the sample results with the following exceptions:

- Boron was detected less than the reporting limit in three EBs for method SW6010B. A total of 31 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Molybdenum or nickel were detected less than the reporting limit in four EBs for method SW6020. A total of 50 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- TPH as Diesel Range Organics/Extended Range Organics were detected greater than the reporting limit in four EBs for method SW8015B-E. Eight associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Several VOCs were detected either less than or greater than the reporting limit in two EBs or TBs for method SW8260B. A total of 22 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Bis(2-ethylhexyl) phthalate was detected less than the reporting limit in five EBs for method SW8270C. A total of 66 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Several PAHs were detected less than the reporting limit in one EB for method SW8270SIM. Thirteen associated results less than five times the blank concentrations were qualified as not detected and flagged "U."
- Dioxins/furans were detected less than the reporting limit in eight EBs for method SW8290. A total of 92 associated results less than five times the blank concentrations were qualified as not detected and flagged "U."

3.5 Field Duplicates

Five water and 30 soil FD sets were collected and analyzed during this event. Precision criteria are based on laboratory established precision values. All precision criteria were met, with the following exceptions:

- The TCLP leachate for lead in one soil FD set for method SW1311/SW6010B exceeded the relative percent difference (RPD) limit of less than 20 percent between the native and field duplicate results. Two detected sample results were qualified as estimated and flagged "J."

- The STLC leachate for vanadium or lead in two soil FD sets for method SW6010B-STLC exceeded the RPD limit of less than 20 percent between the native and field duplicate results. Four detected sample results were qualified as estimated and flagged "J."
- Several metal compounds in two water and 19 soil FD sets for method SW6020 exceeded the RPD limit of less than 20 percent between the native and field duplicate results. A total of 182 detected sample results were qualified as estimated and flagged "J."
- Several SVOCs in six soil FD sets for method SW8270C exceeded the RPD limit of less than 50 percent between the native and field duplicate results. A total of 62 detected sample results were qualified as estimated and flagged "J;" four nondetected sample results were qualified as estimated and flagged "UJ."
- Several PAHs in one water and one soil FD sets for method SW8270SIM exceeded the RPD limit of less than 50 percent between the native and field duplicate results. A total of 19 detected sample results were qualified as estimated and flagged "J;" nine nondetected sample results were qualified as estimated and flagged "UJ."
- Four dioxin or furan compounds in one soil FD set for method SW8290 exceeded the RPD limit of less than 40 percent between the native and field duplicate results. Eight detected sample results were qualified as estimated and flagged "J."

3.6 Surrogates

Surrogate spikes were analyzed in each sample for all required methods. All acceptance criteria were met, with the following exceptions:

- Surrogate recoveries were less than the lower control limit (LCL) in five soil samples for method SW8011. Fifteen associated nondetected sample results were qualified as estimated and flagged "UJ." Surrogate recoveries were less than 10 percent in one soil sample. Three nondetected sample results were rejected from project use and flagged "R."
- Surrogate recoveries were less than the LCL in three water and two soil samples for method SW8015B-E. Five associated detected sample results were qualified as estimated and flagged "J;" Three nondetected sample results were qualified as estimated and flagged "UJ."
- Surrogate recoveries were less than the LCL in three water and four soil samples for method SW8082. One associated detected sample result was qualified as estimated and flagged "J;" 61 nondetected sample results were qualified as estimated and flagged "UJ."
- Surrogate recoveries were either less than the LCL or greater than the upper confidence limit (UCL) in two water and 32 soil samples for method SW8260B. A total of 43 associated detected sample results were qualified as estimated and flagged "J" and 1,009 nondetected sample results were qualified as estimated and flagged "UJ."
- Surrogate recoveries were less than the LCL in 21 soil samples for method SW8270C. A total of 63 associated detected sample results were qualified as estimated and flagged "J;" 493 nondetected sample results were qualified as estimated and flagged "UJ." Surrogate recoveries were less than 10 percent in three soil samples. A total of 19 nondetected sample results were rejected from project use and flagged "R."
- Surrogate recoveries were less than the LCL in seven soil samples for method SW8290. Three associated detected sample results were qualified as estimated and flagged "J;" five nondetected sample results were qualified as estimated and flagged "UJ."

3.7 Internal Standards

Internal standards are compounds that have similar properties as the analytes of interest but are not expected to occur naturally in the samples. Some methods require the use of internal standards to compensate for losses during injection or purging or losses due to viscosity. A measured amount of the internal standard is added to the standards, the samples, and QC samples following preparation. Internal standards were analyzed for all required methods. All acceptance criteria were met.

3.8 Laboratory Control Samples

LCS and LCS duplicates were analyzed as required. Accuracy and precision criteria were met, with the following exceptions:

- The recovery for 1,2-dibromo-3-chloropropane in one soil LCS was greater than the UCL for method SW8011. One associated detected sample result was qualified as estimated and flagged "J."
- The recovery for TPH as Extended Range Organics in one water LCS was less than the LCL for method SW8015B-E. One associated detected sample result was qualified as estimated and flagged "J;" three nondetected sample results were qualified as estimated and flagged "UJ."
- The RPD for Aroclor-1260 in one soil LCS/LCS duplicate exceeded the control limit for method SW8082. One associated detected sample result was qualified as estimated and flagged "J."
- The recoveries for several VOCs in one or more soil LCS were either less than the LCL or greater than the UCL for method SW8260B. Nine associated detected sample results were qualified as estimated and flagged "J;" 119 nondetected sample results were qualified as estimated and flagged "UJ."
- The recoveries for several SVOCs in one or more soil or water LCS were either less than the LCL or greater than the UCL for method SW8270C. A total of 57 associated detected sample results were qualified as estimated and flagged "J;" 372 nondetected sample results were qualified as estimated and flagged "UJ." The recoveries of either benzoic acid or pyridine were less than 10 percent in one or more LCS. A total of 21 nondetected sample results were rejected from project use and flagged "R."
- The RPD for several SVOCs in one or more soil LCS/LCS duplicate exceeded the control limit for method SW8270C. A total of 20 associated detected sample results were qualified as estimated and flagged "J;" two nondetected sample results were qualified as estimated and flagged "UJ."
- The recoveries for several PAHs in one or more soil LCS were less than the LCL for method SW8270SIM. A total of 25 associated detected sample results were qualified as estimated and flagged "J;" 23 nondetected sample results were qualified as estimated and flagged "UJ."

3.9 Matrix Spike/Matrix Spike Duplicate

The results of MS/MSD analyses provide information about the possible influence of the matrix on either accuracy or precision of the measurements. A total of 47 MS/MSD sets were submitted by the field team or selected by the laboratory. All acceptance criteria were met, with the following exceptions:

- The recovery for boron in five soil MS/MSD sets was less than the LCL for method SW6010B. Three detected native sample results were qualified as estimated and flagged "J;" two nondetected native sample results were qualified as estimated and flagged "UJ."
- The recoveries for several metal compounds in 20 soil MS/MSD sets were either less than the LCL or greater than the UCL for method SW6020. A total of 86 detected native sample results were qualified as estimated and flagged "J."
- The RPD for several metal compounds in five soil MS/MSD sets exceeded the control limit for method SW6020. A total of 24 detected native sample results were qualified as estimated and flagged "J."

- The recovery for the STLC leachate of mercury in one soil MSD was less than the LCL for method SW7470A. One detected native sample result was qualified as estimated and flagged "J."
- The recovery for mercury in one soil MS/MSD set was less than the LCL for method SW7471A. One detected native sample result was qualified as estimated and flagged "J."
- The recovery for TPH as Diesel Range Organics/Extended Range Organics in one water and two soil MS/MSD sets were either less than the LCL or greater than the UCL for method SW8015B-E. Four detected native sample results were qualified as estimated and flagged "J."
- The RPD for TPH as Diesel Range Organics/Extended Range Organics in one soil MS/MSD set exceeded the control limit for method SW8015B-E. Two detected native sample results were qualified as estimated and flagged "J."
- The recoveries for several VOCs in 12 soil MS/MSD sets were either less than the LCL or greater than the UCL for method SW8260B. One detected native sample result was qualified as estimated and flagged "J;" 477 nondetected native sample results were qualified as estimated and flagged "UJ." The recoveries for several VOCs in two soil MS/MSD sets were less than 10 percent. Six nondetected native sample results were rejected from project use and flagged "R."
- The recoveries for several SVOCs in 14 soil MS/MSD sets were either less than the LCL or greater than the UCL for method SW8270C. Twelve detected native sample results were qualified as estimated and flagged "J;" 74 nondetected native sample results were qualified as estimated and flagged "UJ." The recoveries for several SVOCs in seven soil MS/MSD sets were less than 10 percent. A total of 14 nondetected native sample results were rejected from project use and flagged "R."
- The RPD for several SVOCs in five soil MS/MSD sets exceeded the control limit for method SW8270C. A total of 22 detected native sample results were qualified as estimated and flagged "J."
- The recovery for several PAHs in one water and two soil MS/MSD sets were less than the LCL for method SW8270SIM. Five nondetected native sample results were qualified as estimated and flagged "UJ."
- The recoveries or RPD for two dioxin compounds in one soil MS/MSD set were greater than the UCL for method SW8290. Two detected native sample results were qualified as estimated and flagged "J."

3.10 Laboratory Duplicates

Laboratory duplicate sets were analyzed at the proper frequency for the required methods. All precision criteria were met, with the exception of RPDs for several metal compounds in five laboratory duplicates exceeded the control limit for method SW6020. A total of 18 detected native sample results were qualified as estimated and flagged "J."

3.11 Estimated Maximum Possible Concentrations

Estimated maximum possible concentrations (EMPCs) were reported for Method SW8290 where ion abundance ratio criteria were not met. One or more analytes in 4 water or 69 soil samples exceedance ion abundance ratio criteria. A total of 205 results were qualified as estimated and flagged "UJ."

3.12 Chain of Custody

Each sample was documented in a completed chain-of-custody form and received at the laboratory within temperature criteria and in good condition.

3.13 Overall Assessment

The final activity in the DQE is an assessment of whether the data meet the required precision, accuracy, representativeness, completeness, and comparability (PARCC). The goal of this assessment is to demonstrate that a sufficient number of representative samples were collected, and the resulting analytical data can be used to support the decision making process. The following summary highlights the data evaluation findings for the above defined events:

1) A total of 65 results for Methods SW8011, SW8260B, or SW8270C were rejected due to low LCS, MS/MSD, or surrogate recoveries, or for hold-time exceedances. The completeness goal of 95 percent for water samples or 90 percent for soil samples were met for all method/analyte combinations, except for benzoic acid which was 86 percent complete in soil. Benzoic acid is a historically poor performing analyte; however, based on common industrial uses this analyte is not considered to be a COPC for this site.
2) Approximately 1.7 percent of the data were qualified due to associated method blank and EB contamination. Approximately 1.8 percent of the data were qualified as estimated because of holding-time issues.
3) Approximately 11 percent of the data were qualified as estimated due to quality control exceedances that included: FD and laboratory RPD exceedances, LCS recovery and RPD exceedances, surrogate and internal standard recovery exceedances, MS/MSD recovery and RPD exceedances, calibration standard exceedances, or ion ratio exceedances resulting in reported EMPC values.
4) Overall, the precision and accuracy of the data, as measured by laboratory and field quality control indicators, indicates that the PARCC were met. Data are usable for project decision-making, considering the biases outlined in this data quality evaluation, except for the rejected data.
5) Representativeness and comparability of the data was achieved through adherence to the sampling plan. Consistent sample collection procedures, project laboratories and analytical methodologies were used throughout the sampling event. Data were reported in consistent methods and units for the sampling events.
6) Sensitivity is a measurement based on the analytical instrument method reporting limits determined by each subcontract laboratory and is ensured through compliance with reporting limits being equivalent to, or less than the project screening levels. Any nondetect results that were reported by the laboratory, or were flagged nondetect due to blank contamination, have been evaluated against the project screening levels as discussed in the work plan.

TABLE 3 - Data Qualification Summary						
NativeID	Method	Analyte	Final Result	Units	Final Validation Flag	Validation Reason

Notes:

CCV<LCL = continuing calibration verification recovery less than the lower control limit

CCV>UCL = continuing calibration verification recovery greater than the upper control limit

EB<RL = analyte detected less than five times associated equipment blank concentration

EB>RL = analyte detected greater than five times associated equipment blank concentration

EMPC = estimated maximum possible concentration

FD>RPD = field duplicate relative percent difference greater than acceptance criterion

HTa>UCL = sample analysis holding time exceeded the method specified control limit

HTp>UCL = sample preparation holding time exceeded the method specified control limit

ICVS<LCL = Initial calibration verification recovery less than the lower control limit

ICVS>UCL = Initial calibration verification recovery greater than the upper control limit

LabDupRPD = laboratory duplicate relative percent difference greater than acceptance criterion

LB<RL = analyte detected less than five times associated laboratory blank concentration

LCS<LCL = laboratory control sample recovery less than the lower control limit

LCS>UCL = laboratory control sample recovery greater than the upper control limit

LCSRPD = laboratory control sample/laboratory contrrol samle duplicate relative percent difference greater than acceptance criterion

TABLE 3 - Data Qualification Summary						
NativeID	**Method**	**Analyte**	**Final Result**	**Units**	**Final Validation Flag**	**Validation Reason**

mg/Kg = miligrams per kilogram

mg/L = milligrams per liter

MS<LCL = matrix spike recovery less than the lower control limit

MS>UCL = matrix spike recovery greater than the upper control limit

MSRPD = matrix spike/matrix spike duplicate relative percent difference greater than acceptance criterion

SD<LCL = matrix spike duplicate recovery less than the lower control limit

SD>UCL = matrix spike duplicate recovery greater than the upper control limit

STLC = Soluble Threshold Limit Concentration

Sur<LCL = surrogate recovery less than the lower control limit

Sur>UCL = surrogate recovery greater than the upper control limit

TCLP = Toxicity Characteristic Leaching Procedure

TB<RL = analyte detected less than five times associated trip blank concentration

ug/Kg = micrograms per kilogram

ug/L = micrograms per liter

Notes:

[a] The screening levels used for human health are the the minimum ODEQ (2018) RBCs for residential soil for direct contact and outdoor inhalation pathways. If no RBCs are available, the EPA (2022) Residential Soil RSL was used. Background values are used if available and if higher. The screening levels used for leaching to groundwater are the ODEQ (2018) RBCs for residential leaching to groundwater.

[b] Background concentrations for metals in soil in Cascade Range (ODEQ 2013)

[c] Human health COPCs are analytes that exceed the human health SL and the background value, if available.

[d] Evaluated using Total 2,3,7,8-TCDD, calculated using toxicity equivalent values.

CAS = Chemical Abstracts Service
COPC = chemical of potential concern
mg/kg = milligrams per kiligram
NA = not available or not applicable
SL = screening level

Suggested UCL to Use

Recommendation cannot be provided

Recommendations are not available due to the sample size and skew of the input data.

Consult with a statistician to evaluate the adequacy of your data to support your objectives or explore alternative estimation methods.

The calculated UCLs are based on assumptions that the data were collected in a random and unbiased manner.

Please verify the data were collected from random locations.

If the data were collected using judgmental or other non-random methods,

J.C. Boyle Dispersed Recreaction Area - 2 ProUCL Output for 0 to 2 Feet Below Ground Surface

then contact a statistician to correctly calculate UCLs.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness using results from simulation studies.
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

nu hat (MLE)	2.445	nu star (bias corrected)	1.945
Mean (detects)	0.0797		

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

J.C. Boyle Dispersed Recreaction Area - 2 ProUCL Output for 0 to 2 Feet Below Ground Surface

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	7.0000E-4	Mean	0.0498

Suggested UCL to Use

95% Student's-t UCL	12.77

The calculated UCLs are based on assumptions that the data were collected in a random and unbiased manner.
Please verify the data were collected from random locations.
If the data were collected using judgmental or other non-random methods,
then contact a statistician to correctly calculate UCLs.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness using results from simulation studies.
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

[a] Risk-based concentrations for freshwater aquatic life (Table 2 Excel Version in ODEQ 2021).

[b] Terrestrial plant effect levels for solutions (Efroymson et al. 1997).

[c] Risk-based concentrations for direct ingestion of water for birds and mammals (Table 1b in ODEQ 2020).

-- = not applicable or not available
µg/L = micrograms per liter
2,3,7,8-TCDD TEQ = 2,3,7,8-Tetrachlorodibenzo-P-dioxin toxic equivalent
DXN = dioxin/furan
ODEQ = Oregon Department of Environmental Quality

Table F-3. Toxicity Reference Values for Birds

	Derivation of No Effect TRV								Derivation of Low Effect TRV							
COPEC	Test Species	Toxicity Value (mg/kg-d)	Study Endpoint	Type	Effects	Source	Uncertainty Factor[a]	Final No Effect TRV (mg/kg-d)	Test Species	Toxicity Value (mg/kg-d)	Study Endpoint	Type	Effects	Source	Uncertainty Factor[a]	Final No Effect TRV (mg/kg-d)
Antimony	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Boron	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--
Copper	Chicken, turkey, duck	4.05	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2007b	1	4.05	Chicken, duck, turkey	34.9	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2007b	1	34.9
Lead	Japanese quail, chicken, kestrel, mallard	1.63	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2005b	1	1.63	Japanese quail, chicken, kestrel	44.63	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2005b	1	44.63
Nickel	Duck, chicken	6.71	NOAEL	Chronic	Geometric mean of growth and reproduction NOAELs - used as TRV for EcoSSL value	EPA 2007c	1	6.71	Duck, chicken	18.6	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth	EPA 2007c	1	18.6
Selenium	Quail, kestrel, mallard, chicken	0.29	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2007d	1	0.29	Quail, kestrel, mallard, chicken	0.819	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2007d	1	0.819
Vanadium	Chicken	0.344	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2005c	1	0.34	Chicken	1.7	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2005c	1	1.7
Zinc	Chicken, quail, duck	66.1	NOAEL	Chronic	Geometric mean of growth and reproduction NOAELs - used as TRV for EcoSSL value	EPA 2007e	1	66.1	Chicken, quail, duck	171	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth	EPA 2007e	1	171

Notes:

[a] Uncertainty factors were applied to normalize the endpoints as follows:

Endpoint	*Type*	*To Final No Effect Level TRV*	*To Final Low Effect Level TRV*
NOAEL	Chronic	1	--
LOAEL	Chronic	--	1

-- = not available, could not be located, or not applicable
EcoSSL = ecological soil screening level
EPA = U.S. Environmental Protection Agency
LOAEL = lowest observed adverse effect level
mg/kg-d = milligrams per kilogram body weight per day
NOAEL = no observed adverse effect level
TRV = toxicity reference value

Table F-4. Toxicity Reference Values for Mammals

	Derivation of No Effect TRV								Derivation of Low Effect TRV							
COPEC	Test Species	Toxicity Value (mg/kg-d)	Study Endpoint	Type	Comments	Source	Uncertainty Factor[a]	Final No Effect TRV (mg/kg-d)	Test Species	Toxicity Value (mg/kg-d)	Study Endpoint	Type	Comments	Source	Uncertainty Factor[a]	Final No Effect TRV (mg/kg-d)
Antimony	Rat	0.059	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2005a	1	0.059	Rat	2.76	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2005a	1	2.76
Boron	Rat	10.3	BMDL5	Chronic	Reproductive - reduced fetal body weight	EPA 2021	1	10.3	Rabbit	43.7	LOAEL	Chronic	Developmental effects	Heindel et al. 1994 in EPA 2021	1	43.7
Copper	Mink, mouse, rat, pig, rabbit, cattle	5.6	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2007b	1	5.6	Mink, mouse, rat, pig, rabbit, cattle	82.7	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2007b	1	82.7
Lead	Hamster, mouse, rat	4.7	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2005b	1	4.7	Hamster, mouse, Rat	186	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2005b	1	186
Nickel	Mouse, vole, rat, dog, cattle	7.7	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2007c	1	7.7	Mouse, vole, rat, dog, cattle	14.8	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2007c	1	14.8
Selenium	Rat, mouse, pig	0.14	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2007d	1	0.143	Rat, mouse, pig	0.66	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2007d	1	0.66
Vanadium	mouse/rat/sheep/pig	4.16	NOAEL	Chronic	Highest bounded NOAEL lower than the lowest bounded LOAEL for reproduction, growth or survival - used as TRV for EcoSSL	EPA 2005c	1	4.16	Mouse, rat, sheep, pig	9.40	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2005c	1	9.4
Zinc	Rat, pig, hamster, rabbit, mouse, cattle, sheep	75.40	NOAEL	Chronic	Geometric mean of NOAELs from reproduction and growth studies - used as the TRV for EcoSSL	EPA 2007e	1	75.4	Rat, pig, hamster, rabbit, mouse, cattle, sheep	298	LOAEL	Chronic	Geometric mean of LOAELs reported for reproductive and growth endpoints.	EPA 2007e	1	298

Table F-4. Toxicity Reference Values for Mammals

	Derivation of No Effect TRV								Derivation of Low Effect TRV							
COPEC	Test Species	Toxicity Value (mg/kg-d)	Study Endpoint	Type	Comments	Source	Uncertainty Factor[a]	Final No Effect TRV (mg/kg-d)	Test Species	Toxicity Value (mg/kg-d)	Study Endpoint	Type	Comments	Source	Uncertainty Factor[a]	Final No Effect TRV (mg/kg-d)

Notes:

[a] Food intake rates (IRf) were calculated using allometric relationships for the receptor group as listed below and normalized to body weight in units of kg/kg-bw/d using the following regression from Nagy (2001): Food Ingestion Rate (grams dry matter ingested/day/gram body weight) = (a x BW^b)/BW

Receptor	*Group*	*a*	*b*	bw	IRf
Hermit thrush	insectivorous birds	0.54	0.705	0.0301	0.198
Mourning dove	granivore (all birds)	0.638	0.685	0.112	0.144
Red-tailed hawk	carnivorous birds	0.849	0.663	0.96	0.084
Coyote	carnivorous mamma	0.102	0.864	10	0.029
Deer mouse	rodentia	0.332	0.774	0.0193	0.170
Vagrant shrew	insectivorous mamr	0.373	0.622	0.008	0.170

[b] Soil ingestion rates are as follows:

Receptor	*Soil ingestion %*	*Notes/Source*
Hermit thrush	10.4%	Assume similar to woodcock (Beyer et al., 1994)
Mourning dove	6.1%	Median soil ingestion rate estimated for mourning dove in Table 3 of the USEPA EcoSSL guidance (2007a)
Red-tailed hawk	2.4%	Median soil ingestion rate estimated for red-tailed hawk in Table 3 of the USEPA EcoSSL guidance (2007a)
Coyote	2.8%	Assumed comparable to red fox (Beyer et al., 1994)
Deer mouse	2.0%	Value for white-footed mouse (Beyer et al., 1994)
Vagrant shrew	3.0%	90th percentile for shrews as derived by USEPA EcoSSL guidance (2007a)

-- = not available
BAF = bioaccumulation factor
EcoPRG = ecological preliminary remedial goal
HQ = hazard quotient
kg = kilogram
kg/kg-d = kilogram per kilogram per day
mg/kg = milligram per kilogram
mg/kg-d = milligram per kilogram per day
TEQ = dioxin toxicity equivalents
TRV = wildlife toxicity reference value
Most conservative receptor-specific EcoPRG for birds or mammals

Table F-7. Area Use Factors for Ecological Receptors

Representative Species	Home Range (acres)	J.C. Boyle Recreation Area - 2	
		Exposure Area (acres)	Area Use Factor (AUF)
Hermit thrush	1.784	0.023	0.01289
Mourning dove	247	0.023	0.00009
Red-tailed hawk	193	0.023	0.00012
Coyote	70	0.023	0.00033
Deer mouse	2.34	0.023	0.00983
Vagrant shrew	1.07	0.023	0.02150

Notes:

Area Use Factor (AUF) is calculated by dividing the acreage of the exposure area by receptor's foraging range. If the foraging range is smaller than the site acreage, the AUF defaults to 1.

The AUFs for the hermit thrush and the vagrant shrew (highlighted in green) were selected for use in the risk estimates as these were the receptors with the lowest (most conservative) ecological preliminary remedial goals for the majority of analytes evaluated in Step 3.

Table F-8. Uncertainty Analysis

Assessment Element	Uncertainty	Magnitude of Impact	Direction of Impact
Problem Formulation			
Fate and Transport	It is assumed that chemical concentrations will not change over time, and that concentrations are constant during the exposure duration. Natural attenuation and/or other degradation processes may be significant in some areas resulting in an over-estimation of exposure.	Moderate	Over-estimation of exposure/risk
Representative Species	Representative species were selected to reduce uncertainty; however, differences among species including physiology, reproductive biology, and/or foraging habits can result in different exposures and sensitivities for different receptors.	Low	Over- or under-estimation of exposure/risk
Exposure Pathway Analysis	Exposure routes that are considered minor (inhalation and dermal exposure) were not included in the risk estimation. Although exposure via these routes still contributes to the total risk to each receptor, potential risks may be underestimated because these routes were not quantified.	Low	Under-estimation of exposure/risk
Analysis			
Wildlife Exposure Factors	Exposure parameters for birds and mammals were either modeled using allometric relationships (e.g., food ingestion rates) or were estimated using data from a similar species (soil ingestion rates). Use of modeling and surrogates is a potential source of uncertainty depending on the differences between site-exposures vs. laboratory exposures and differneces in the selected representative species and the surrogate	Low	Over- or under-estimation of exposure/risk
Bioaccumulation Factors	Literature-based bioaccumulation factors and regression models were used to estimate bioaccumulation. These uptake rates may differ from site-specific rates.	Moderate	Over- or under-estimation of exposure/risk
Bioavailability	Bioavailability of analytes is assumed to be 100%. This likely overestimates risk from some analytes.	Low	Over-estimation of exposure/risk
Exposure Point Concentrations	Risks were estimated on a sample-specific basis. This provides a very conservative evalution as representative species do not spend their entire lifetiime at one sample location. Their actual exposure varies as they forage or travel in the vicinity of the site.	Moderate	Over-estimation of exposure/risk
Risk Characterization			
Risk Estimation	Potential ecological risks were quantified using the HQ approach. The magnitude of the HQ indicates potential for ecological risk, but is not an exact estimation of risk. For example, the actual risk from a chemical with an HQ of 70 could be less than that for a chemical with an HQ of 20 because of uncertainties involved in estimating exposure, selection of effects criteria (TRVs), or field conditions affecting exposure.	Moderate	Over- or under-estimation of risks

Notes:
HQ = hazard quotient
LOAEL = lowest observed adverse effect level
NOAEL = no observed adverse effect level
TRV = toxicity reference value

Notes:

[a] Screening Levels - No Effect ESLs are based on no observed adverse effect levels (NOAELs) and are the most conservative among plants, invertebrates, birds, and mammals. Low Effect ESLs are based on lowest observed adverse effect levels (LOAELs) for birds and mammals.

[b] Site-specific ecological preliminary remedial goals (EcoPRGs) are risk based concentrations calculated for receptors that would potentially be found in the area around the site. The bird and mammal EcoPRGs selected for use in the risk estimates are the most conservative of the risk-based values calculated for birds and mammals from the major feedng guilds (herbivores, invertevores, and carnivores) using LOAEL toxicity values and an AUF=1 (100% site use). Supporting information and calculation of EcoPRGs is presented in Appendix F, Table F-3 thorugh Table F-7.

[c] Area use factors for the hermit thrush and vagrant shrew were selected for use in the risk estimates as these two receptors had the most conservative risk-based concentrations. The AUF is calculated from the receptors home range vs the size of the REC. Supporting information and calculation of AUFs is presented in Appendix F, Table F-7.

-- = not available or not applicable
<1 = less than 1
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient - all values presented to 1 significant figure
ND = not detected
RSL = refined screening level
step 1 = analyte was eliminated in Step 1 of the ecological risk evaluation. No Effect screening HQ was less than 1
step 2 = analyte was retained after Step 1 (the screening HQ>1), but was eliminated in Step 2 (the refined HQ <1).

Table F-10. Ecological Risk Estimates for Groundwater Exposure Pathways

																No Effect Screening Levels[a]			Low Effect Screening Levels[b]			Screening HQs			Refined HQs			Summary

Notes:

[a] No Effect ESLs are based on chronic effects for aquatic life or no observed adverse effect levels (NOAELs) for terrestrial plants, birds, mammals.

[b] Low Effect ESLs are based on acutec effects for aquatic life or lowest observed adverse effect levels (LOAELs) for terrestrial plants, birds, mammals.

-- = not available or not applicable
<1 = less than 1
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient - all values presented to 1 significant figure
ND = not detected
RSL = refined screening level
step 1 = analyte was eliminated in Step 1 of the ecological risk evaluation. No Effect screening HQ was less than 1
step 2 = analyte was retained after Step 1 (the screening HQ>1), but was eliminated in Step 2 (the refined HQ <1).

Consolidated Comment Matrix

COMMENT MATRIX for the Stakeholder Review Draft Dated October 2022
Lower Klamath Hydroelectric Project Site Investigation Reports for California and Oregon
FERC No. P-14803
March 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
California Department of Fish and Wildlife - Office of Spill Prevention and Response/California Department of Water Resources (Comments on the California Site Investigation Report)					
CA-General-1	KT	General Comment		[This comment #1 may be withdrawn. CDFW is double checking and will be in touch] CDFW-OSPR is concerned that the lack of screening data for lead shot and target fragments (a potential source of PAHs) is a data gap that PacifiCorp needs to address. The deleterious effects of wildlife ingestion of lead shot or bullet fragments have been well documented over many years and in numerous scientific studies (Rattner et al. 2008). CDFW-OSPR considers lead shot as a poison under California Fish and Game Code section 3005. Additional clarification emailed by Kevin Takei (California) to Demian Ebert (PacifiCorp) on January 11, 2023, at 9:01 AM: "CDFW is fine withdrawing the comment because we understand KRRC will be disposing dam debris on top of the shooting range. As a result the likelihood of wildlife ingesting lead shot/bullet fragments will be low. If KRRC changes its plans and ends up not disposing debris on the shooting range, CDFW would like to reopen this comment."	Acknowledged. No changes necessary.
CA-General-2	KT	General Comment		For sites recommended for removal actions, CDFW is not commenting on the recommendations. CDFW anticipates providing input on specific actions during preparation of the removal action plans.	Acknowledged. No changes necessary.
CA-1	KT		Page 3-11, Section 3.3.4.1 Derivation of Site-Specific EcoPRGs	The method used to calculate ecological preliminary remedial goal in soil is acceptable, as are the bioaccumulation factors used (Appendix G, Tables G-5).	Acknowledged. No changes necessary.
CA-2	KT		Page 5-1, Section 5.1	Was trash and other debris removed or does it remain?	Debris and trash have not been removed, but will be before PacifiCorp stops operating the Lower Klamath Project. No changes necessary.
CA-3	KT		Page 6-9, Section 6.7 Recommended Actions	May need to coordinate implementation of the remedial action plan with any restoration activity by RES.	PacifiCorp expects that the removal action plan would be coordinated with the KRRC's team to identify waste staging areas, stockpile management, soil reuse, backfill and compaction, and offsite disposal requirements all with an eye toward reducing potential conflicts and schedule impacts on dam removal and restoration activities. No changes necessary.
CA-4	KT		Appendix D: Analytical Laboratory Results	CDFW-OSPR requests PacifiCorp ensure that the laboratory, Eurofins/TA is a California state-certified analytical laboratory. CDFW-OSPR requests the PacifiCorp include a current certification document as an appendix to the Draft Final document.	Eurofins/TA has provided their certification in the California Environmental Laboratory Accreditation Program and that document has been added to Appendix D. Note that the certificate expired on 7/7/2022. Eurofins/TA has applied for a renewal, which is in progress, and all samples were analyzed prior to that date.

COMMENT MATRIX for the Stakeholder Review Draft Dated October 2022
Lower Klamath Hydroelectric Project Site Investigation Reports for California and Oregon
FERC No. P-14803
March 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
CA-5	KT		Appendix E, Data Quality Evaluation Report	CDFW-OSPR has concerns regarding the substituted phenol data. The surrogate QC indicates that samples may have been mishandled during extraction yielding results that are biased low. Please to include a current certification document as an appendix to the Draft Final document to estimate the impact. Additional clarification emailed by Kevin Takei (California) to Demian Ebert (PacifiCorp) on January 23, 2023, at 3:36 PM: "This was an observation of a trend in one batch of semi-volatiles that the substituted-phenol surrogates were reported with low recoveries; the corresponding quality control samples also were reported with low substituted-phenol recoveries. Aggressive extract concentration is suspected to affect substituted-phenol surrogate recoveries and by association, substituted phenol compounds in samples. The data was appropriately flagged by the validators. No certification is needed."	Acknowledged. No changes necessary.
CA-6	KT		Appendix E, Data Quality Evaluation Report	Please clarify how the validators used data flagged as "J" or "UJ" to identify the maximum concentration detected or if the data was ignored. Additional clarification emailed by Kevin Takei (California) to Demian Ebert (PacifiCorp) on January 23, 2023, at 3:36 PM: "My question is regarding how the validators calculated the maximum possible concentrated for compounds where the compound is flagged "UJ." If recoveries for a compound was low, was the maximum possible concentration calculated based on the reporting limit, or a recovery-corrected result?"	For Section 3.11, the laboratory originally reported the analytical data for various dioxin/furan congeners as "estimated maximum possible concentrations" that were considered detectable by the laboratory and flagged with a "J" (estimated). However, during data validation by Jacobs, it was determined that the ion ratio criteria were exceeded for these congeners. Consequently, the data validator changed the final flag to "UJ" (estimated non-detect). The original estimated result values were not changed and no additional calculations or adjustments were made. No changes necessary.
CA-7	KT		Appendix E, Data Quality Evaluation Report	The Data Quality Evaluation Report is missing the required signatures of the Project Manager/Senior Chemist, who validated the data.	Signature of Mark Fessler/Senior Chemist has been provided in the final report.
CA-8	KT			Appendix G, Table G-6. It is not clear how the HQ was calculated when the incidental soil ingestion rate for the Red-tailed Hawk of 2.4% was used. Based on the 90th percentile from a Monte Carlo simulation, a 5.2% soil ingestion rate (as proportion of diet) is used for the Red-tailed Hawk in the USEPA Eco-SSLs (https://www.epa.gov/risk/ecological-soil-screening-level-eco-ssl-guidance-and-documents).	The percentage of soil ingestion for the red-tailed hawk used in the analysis is the 50th percentile as shown on Table 3 of the EcoSSL guidance. The 90th percentile is applicable for the calculation of the EcoSSLs, which are the most conservative values used for screening purposes. Remedial actions and calculation of preliminary remedial goals (EcoPRGs) are typically based on more realistic exposure and toxicity assumptions, i.e., lowest observed adverse effect levels and median (i.e., 50th percentile) uptake rates. It should be noted that the EcoPRGs remain conservative in that the fraction of soil ingestion is added onto the food ingestion rate rather than considered part of the total food ingestion rate (i.e., 100% food plus additional 2.4% soil = 102.4% total intake). No changes necessary.

COMMENT MATRIX for the Stakeholder Review Draft Dated October 2022
Lower Klamath Hydroelectric Project Site Investigation Reports for California and Oregon

March 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
CA-9	KT			*Appendix G, Table G-9 through Table-18*. There is no mention of the calculation of hazard indices for chemicals with a similar mechanism of action. Please address the cumulative risk potential for all receptors based on co-exposure to COPECs with similar chemical structures or modes of toxicity. CDFW OSPR recommends the following: i. Hazard indices (HIs) be calculated for chemicals with a common mechanism of action or common target organs [examples of chemical groups would be: polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds, semivolatile organic compounds, total petroleum hydrocarbons]. ii. Chemicals do not exit the screening-level ERA even if the HQ for that particular chemical is less than one unless the HI for that group of chemicals is less than one. Following DTSC guidance (DTSC HERO 1996) will ensure that chemicals are not eliminated inadvertently when the incremental summing of effects adds up to HI greater than 1.	As the comment notes, hazard indices (HIs) are typically computed for chemicals within groups with similar toxic action; however, these are generally limited to PAHs, PCBs, and organochlorine pesticides. Summing of volatiles and petroleum products has not been conducted for this project because it is not recommended by DTSC guidance and is not standard practice. It should be noted that DTSC guidance (1996) provides a general framework and set of approaches to use when evaluating potential risks. It does not constitute a rigid system of points of departure. Sample-specific HIs for low molecular weight PAHs, high molecular weight PAHs, and aroclors have been added to Appendix G for all sites with detected analytes in these groups. Since EcoPRGs were not derived for all PAHs or aroclors, the HIs are computed using the EcoPRG (if available) or the Low Effect ESL. HIs were computed both with and without application of AUFs. This information has been included in the ecological risk assessment section for each site and the weight of evidence discussion where applicable.
CA-10	JD	General Comment		I do not have any comments or questions regarding this report. Thank you for conducting a very thorough assessment.	Acknowledged. No changes necessary.
CA-11	KG	General Comment		I also did not have any comments or questions. Thanks!	Acknowledged. No changes necessary.

March 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
Klamath River Renewal Corporation (Comments on the California and Oregon Site Investigation Reports)					
KRRC-1	LL	General Comment on Both Reports		KRRC endorses the comments submitted by California and Oregon, including but not limited to CDFW General Comment No. 2: "For sites recommended for removal actions, CDFW is not commenting on the recommendations. CDFW anticipates providing input on specific actions during preparation of the removal action plans."	Acknowledged. No changes necessary.
KRRC-2	LL	Both Reports	Section 1.2 last paragraph	We note that the characterization of the Memorandum of Resolution in the last paragraph of Section 1.2 of each report is not quite accurate – the MOR doesn't establish a process; it marks the completion of the process. I suggest rewording it as follows: "Site closure refers to a site closure agreed upon by PacifiCorp, KRRC, and the State of [California/Oregon] in a Memorandum of Resolution."	The final paragraph in Section 1.2 has been edited: "Recommended next steps will be provided for each REC based on the results of the risk evaluation. Next steps may consist of a request for REC closure, collection of additional environmental samples, or site remediation (Figure 1-5). If risk evaluation of the analytical results indicates acceptable risk, PacifiCorp will request closure of the REC. As used in this report, site closure refers to a closure action agreed upon by PacifiCorp, KRRC, and California and documented in a Memorandum of Resolution. If analytical results of COPCs indicate the risk is unacceptable, PacifiCorp will either propose advancement of step-out borings to collect additional samples according to the sampling plan established for the REC or develop a remediation plan based on the field and analytical data already collected." The corresponding edit is made in the Oregon Site Investigation Report.

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
Oregon Department of Justice (Comment on the Oregon Site Investigation Report)					
OR-1	CM	General Comment		Oregon does not have any specific comment, but we do want to make a general inquiry about upcoming site work and PAC/Jacobs awareness and protocols around cultural resources. Work on the Oregon site may need to be cognizant of such matters and a plan needs to be in place. Please advise.	PacifiCorp is fully aware of the cultural resources potentially present at the various sites. All the sites have been reviewed by specialists and some have been cleared for work because there are no resources present. Others are in proximity to known sites and will require a monitor to be present during work. None of the sites are within known cultural resource sites. Cultural monitors were present during sampling as necessary and will be present during any clean-up work. All contractors also operate in compliance with PacifiCorp's inadvertent discovery plan. No change necessary.

VOC	volatile organic compound

1. Introduction

PacifiCorp retained Jacobs Engineering Group Inc. (Jacobs) to prepare this *California Site Investigation Report* (California SI Report) for the Lower Klamath Hydroelectric Project (Project). The purpose of the California SI Report is to document the environmental sampling activities performed at the location of 11 pre-existing environmental conditions within the Copco No. 1, Copco No. 2, and Iron Gate developments in California. Ten of the pre-existing environmental conditions were identified during Phase I environmental site assessments (Phase I ESAs) conducted by AECOM Technical Services, Inc. (AECOM) on behalf of the Klamath River Renewal Corporation (KRRC) and were subsequently identified in Exhibit C of a Property Transfer Agreement (Agreement) between PacifiCorp and the KRRC. PacifiCorp elected to additionally include assessment of the Copco No. 2 Powerhouse Transformer Fire site, bringing to 11 the total number of sites evaluated under this California SI Report.

While the Agreement and specifically Exhibit C discuss the resolution of pre-existing environmental conditions, the *California Site Investigation Work Plan* (California SIWP) (Jacobs 2021a) and this California SI Report refer to the Exhibit C items generically as recognized environmental conditions (RECs). Not all pre-existing environmental conditions in Exhibit C have been formally identified as a REC in a Phase I ESA. The term REC is used interchangeably with pre-existing environmental condition and site throughout this document.

The environmental sampling activities were performed in accordance with the California SIWP to confirm the presence or absence of constituents of potential concern (COPCs) at the 11 sites or alternatively to confirm the extent of COPCs previously identified. The sites evaluated under this California SI Report are as follows (Figures 1-1 to 1-4):

1) Copco No. 1 Dynamite Cave
2) Copco No. 1 Debris Piles/Scrap Yard (Parcel B REC 4)
3) Wood-Stave Penstock
4) Copco No. 2 Wood Pile (Parcel B REC 7)
5) Copco No. 2 Powerhouse Transformer Fire (not included in Exhibit C of the Agreement)
6) Copco No. 2 Former Mobile Oil Containment Building
7) Underground Storage Tanks (USTs)
8) Copco No. 2 Burn Pit (Parcel B REC 6)
9) Iron Gate Shooting Range (Parcel B REC 9)
10) Iron Gate Hatchery Burn Pit
11) Iron Gate Hatchery Settling Ponds

The California SIWP was approved by the KRRC (Lowy, pers. comm. 2021) and the State of California. A separate *Oregon Site Investigation Work Plan* (Oregon SIWP) was developed for the J.C. Boyle Development and its single REC, the J.C. Boyle Dispersed Recreational Area – 2 (Jacobs 2021b). The Oregon SIWP was approved by the KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021). PacifiCorp has prepared an Oregon SI Report (Jacobs 2023) in accordance with Section 4 of the Oregon SIWP.

1.1 Background

The California SIWP provides detailed backgrounds of the Copco No. 1, Copco No. 2, and Iron Gate developments, a complete list of the Exhibit C RECs, and a discussion of the surrounding lands, local geology, and historical practices (Jacobs 2021a). This information is incorporated into this California SI Report by reference.

Also pertinent to the sites addressed in this California SI Report are: 1) the two Phase I ESAs conducted for the Oregon and California hydroelectric developments (AECOM 2018, 2020a); and 2) two soil investigations performed for the Iron Gate Burn Pit and the Copco No. 2 Wood-Stave Penstock (AECOM 2019, 2020b).

Of importance to note regarding each site and the development of both SIWPs are the following:

- There were no records of spills or releases at most of the sites, no site investigations had been conducted, and therefore actual site conditions at each site were not known.
- Sampling plans for each site were developed consistent with industry standards and were based on assumed conditions (historical site activities and likely contaminants) at each site.
- Site-specific sampling plans were developed to determine if the COPCs summarized in Section 1.3 (Investigative Standard and Future Site Uses) are present at concentrations that exceeded screening levels.
- The COPCs for each site were selected using the most conservative (i.e., lowest) screening levels for residential, ecological, and leaching to groundwater exposure scenarios and on the understood future use for each site, as agreed upon by the KRRC and the State of California.

The dams and associated powerhouses have been, and continue to be, operated to generate and distribute electricity. Hazardous materials that have been used onsite include diesel fuel, leaded and unleaded gasoline, non-polychlorinated biphenyls (non-PCBs), and governor, transformer, and motor oils. Battery banks and oils are stored within secondary containment systems. As noted in the Phase I ESA conducted by AECOM, the powerhouses appeared to be in good operating condition, with proper housekeeping and hazardous materials management practices (AECOM 2018).

1.2 Objectives

The primary objective of this California SI Report is to document the field activities and analytical results to support the following recommended actions, as applicable, for each site:

- No further action and site closure
- Additional assessment through field sampling
- Development of a remedial action plan

Recommended next steps will be provided for each site based on the results of the risk evaluation. Next steps may consist of a request for site closure, collection of additional environmental samples, or site remediation (Figure 1-5). If risk evaluation of the analytical results indicates acceptable risk, PacifiCorp will request closure of the site. As used in this report, site closure refers to a closure action agreed upon by PacifiCorp, KRRC, and California and documented in a Memorandum of Resolution. If analytical results of COPCs indicate the risk is unacceptable, PacifiCorp will either propose advancement of step-out borings to collect additional samples according to the sampling plan established for the site or develop a remediation plan based on the field and analytical data already collected.

1.3 Investigative Standard and Future Site Uses

The COPCs for each site (Table 1-1) were determined based on the Investigative Standard, as defined in Section 1.5 of the California SIWP (Jacobs 2021a), on expectations for the type of site identified, and where applicable, on identified COPCs from prior site assessments. All fieldwork and data evaluations were carried out in accordance with the Investigative Standard. The COPCs, intended future site uses, and exposure pathways for each site (Table 1-1) were identified in the California SIWP and approved by KRRC and the State of California. The exposure pathways were used to determine the screening levels developed

in Section 3.3 of the California SIWP and to evaluate the analytical results in Sections 5 through 13 of this report.

Table 1-1. Sites, Constituents of Potential Concern, Future Site Uses, and Exposure Pathways

Site	Constituents of Potential Concern	Future Site Use(s)	Exposure Pathways
Copco No. 1 Dynamite Cave	Explosives	Permanently sealed	Not applicable
Copco No. 1 Debris Pile/Scrap Yard	Title 22 metals, VOCs, SVOCs, dioxins and furans	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater
Copco No. 2 Wood-Stave Penstock	Title 22 metals and SVOCs	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater
Copco No. 2 Wood Pile	Title 22 metals, VOCs, and SVOCs	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater
Copco No. 2 Powerhouse Transformer Fire	BTEX, TPH-diesel, PAHs, and PCBs	Active recreation	Residential/Leaching to Groundwater
Copco No. 2 Former Mobile Oil Containment Building	VOCs, TPH-gasoline, TPH-diesel, and PAHs	Active recreation	Residential/Leaching to Groundwater
Copco No. 2 Underground Storage Tanks	VOCs, TPH-gasoline, TPH-diesel, and PAHs	Active recreation	Residential/Leaching to Groundwater
Copco No. 2 Burn Pit	Title 22 metals, VOCs, SVOCs, VOCs, TPH-gasoline, TPH-diesel, PAHs, dioxins and furans	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater
Iron Gate Shooting Range	Title 22 metals and PAHs	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater
Iron Gate Hatchery Burn Pit	Title 22 metals, VOCs, SVOCs, VOCs, TPH-gasoline, TPH-diesel, PAHs, dioxins and furans	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater
Iron Gate Hatchery Settling Ponds	None	Passive recreation/ natural habitat	Residential/Ecological/Leaching to Groundwater

Notes:

BTEX = benzene, toluene, ethylbenzene, and xylenes
PAHs = polynuclear aromatic hydrocarbons
PCBs = polychlorinated biphenyls
SVOCs = semivolatile organic compounds
TPH = total petroleum hydrocarbon
VOCs = volatile organic compounds

1.4 Report Organization

This California SI Report contains the following sections and appendixes:

- **Section 1 – Introduction**: Describes the California SI Report purpose, provides background information on the evolution of the RECs, objectives of the California SI Report, Investigative Standards utilized, future uses, applicable receptor pathways, and COPCs of each REC.
- **Section 2 – Field Activities**: Provides a general overview of the field activities performed during California SIWP implementation.
- **Section 3 – Risk Assessment Approach**: Describes the general risk assessment approach used to evaluate human health risk, leaching to groundwater, and ecological risk from COPCs.
- **Sections 4 to 13 – Field Activities, Results, Risk Assessment, and Recommendations by Site**: Summarizes the site-specific field activities, analytical results, site risk assessment, and recommendations for next steps at each site.
- **Section 14 – Summary of Recommendations**: Summarizes the recommendations for further action at the 11 sites.
- **Section 15 – References**: Provides a bibliographic listing of documents cited in this California SI Report.
- **Appendix A – Siskiyou County Well Permits**: Contains the water well permits from the Siskiyou County Community Development-Environmental Health Division for the soil borings advanced at each site.
- **Appendix B – Boring Logs**: Contains coordinates for borehole locations based on Global Positioning System (GPS) surveys and borehole logs at the sites.
- **Appendix C – Waste Manifests**: Provides the waste manifests used for transport and disposal of wastes generated during the field mobilizations.
- **Appendix D – Analytical Laboratory Results**: Provides the analytical laboratory results of all samples collected from each of the boreholes and highlights results that exceeded a screening level.
- **Appendix E – Data Quality Evaluation Report**: Assesses the data quality of the analytical results for soil and water samples collected at the sites.
- **Appendix F – Human Health and Leaching to Groundwater Risk Evaluation Tables**: Provides the supporting tables of calculations for the human health risk evaluations and the leaching to groundwater evaluations for each of the sites.
- **Appendix G – Ecological Risk Evaluation Tables**: Provides the supporting tables of calculations for the ecological risk evaluations for each of the sites.
- **Appendix H – Copco No. 1 Dynamite Cave Technical Memorandum**: Provides a technical memorandum that documents the field activities and observations from the Copco No. 1 dynamite cave assessment conducted in March 2022.
- **Appendix I** – **Consolidated Comment Matrix**: Contains consolidated review comments and responses from California, KRRC, and Oregon on the stakeholder review draft dated October 2022 as well as supplemental comments received and discussed following the initial round of comments.

2. Field Activities

The California SIWP (Jacobs 2021a) was implemented under two mobilizations performed in February-March 2022 and May 2022. Drilling permits (Appendix A) were obtained from the Siskiyou County Community Development-Environmental Health Division prior to mobilizing to the field. Field activities were documented daily in field logbooks and on tablets. The scopes of work specific to each site were implemented as outlined in the California SIWP. Field activities primarily included the following:

- Soil borings were marked based on their planned coordinates from the California SIWP. During the first mobilization, soil borings were marked the week of February 28, 2022, at the following sites:
  - Copco No. 1 Debris Pile/Scrap Yard
  - Copco No. 2 Wood Pile
  - Copco No. 2 Powerhouse Transformer Fire
  - Copco No. 2 Former Mobile Oil Containment Building
  - Copco No. 2 Underground Storage Tanks
  - Copco No. 2 Burn Pit
- The Copco No. 1 Dynamite Cave was investigated during the first mobilization.
- During the second mobilization, soil borings were marked the week of May 2, 2022, at the following sites:
  - Copco No. 2 Wood-Stave Penstock
  - Copco No. 2 Former Mobile Oil Containment Building (7 additional soil borings)
  - Copco No. 2 Underground Storage Tanks (5 additional soil borings)
  - Copco No. 2 Burn Pit
  - Iron Gate Shooting Range
  - Iron Gate Fish Hatchery Burn Pit
- The marked soil borings were cleared for the presence of subsurface utilities by a subcontracted utility locator service and were moved if subsurface utilities were identified, or as required based on field conditions.
- A hand auger or direct-push technology (DPT) drill rig was used to advance each cleared soil boring.
- Soil samples were collected at specified sample intervals for each REC, for headspace analysis with a photoionization detector (PID), and for borehole logging purposes. If groundwater was encountered, groundwater samples were also collected.
- Collection of shallow and deep soil samples for analysis of site-specific COPCs was conducted as identified in the California SIWP. Soil sampling was performed according to Appendix A of the California SIWP.
- At select sites, grab water samples were collected with disposable bailers from temporary wells constructed with 1-inch-diameter Schedule 40 polyvinyl chloride blank casing and 5 feet of slot screen. Upon collecting the water samples, the temporary well casing was removed so that the soil boring could be abandoned.
- All soil borings were surveyed with a hand-held GPS unit. The final survey coordinates and the boring logs for each soil boring are presented in Appendix B.
- Waste soil and water samples were collected for waste characterization and profiling purposes prior to offsite disposal according to applicable state and federal requirements (Section 2.1).

- Upon completion of sampling activities, each soil boring was abandoned with hydrated bentonite pellets and under purview of a Siskiyou County inspector.

Details of the specific soil sampling activities for each site are summarized in Sections 5 through 12.

2.1 Waste Management

Wastes generated from soil sampling activities included general refuse, soil cuttings from hand auger and DPT drilling, and rinsate water from decontamination of equipment. General refuse was disposed of in trash bins used by PacifiCorp. Soil cuttings and rinsate water were segregated by waste type and site and were contained in labeled, United Nations (UN)-approved 5-gallon buckets or UN-approved 55-gallon drums staged within a secured area near the Copco No. 2 Powerhouse or Iron Gate Dam.

Waste samples were collected from each site for waste profiling purposes. Upon waste characterization and acceptance by the landfill operator, Waste Management, waste soil was consolidated in UN-approved 55-gallon drums for transport and disposal as nonhazardous waste by the waste transporter, EnviroServe, Inc., at Waste Management's Hillsboro Landfill in Hillsboro, Oregon. Upon waste acceptance by the oil recycling firm, Oil Re-Refining, rinsate water was consolidated into a UN-approved 55-gallon drum for transport and disposal as nonhazardous wastewater by EnviroServe, Inc., at Oil Re-Refining in Portland, Oregon. Waste manifests and bills of lading are compiled in Appendix C.

2.2 Sample Collection and Management

The soil samples were collected in glass jars or TerraCore kits provided by the analytical laboratory and in accordance with the Sampling and Analysis Plan (Appendix A of the California SIWP). The soil samples were labeled, placed in resealable plastic bags, and stored in an insulated cooler that was chilled to maintain a shipping temperature of about 4 degrees Celsius. The sample cooler contained a temperature blank used for recording the temperature of samples in the cooler upon arrival at the laboratory. For coolers containing volatile organic compounds (VOCs) or total petroleum hydrocarbon-gasoline (TPH) samples, a trip blank was used to assess the possibility of cross-contamination when transporting the samples to the laboratory. A chain-of-custody form was completed in the field and accompanied all samples during transport to the analytical laboratory, Eurofins Test America in Tacoma, Washington (Appendix D). Test America distributed some samples to other laboratories as required to complete the analysis. Laboratory analyses were performed in accordance with current U.S. Environmental Protection Agency (EPA) procedures and by a laboratory certified by the California State Environmental Laboratory Accreditation Program Branch.

3. Risk Assessment Approach

This section describes the general risk assessment approach used to evaluate human health risk, leaching to groundwater, and ecological risk from COPCs in soil at all sites, and human health risk from COPCs in groundwater at three sites. Risk managers used the results of this analysis to support risk management decisions for each site.

3.1 Human Health Risk Assessment

A streamlined human health risk assessment (HHRA) was conducted for each site to evaluate human health risk to applicable receptors from exposure to contaminants in soil and groundwater. The HHRA provides information that can support risk-management decision making, including the need for further action.

This HHRA was conducted in a manner consistent with the following California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) guidance:

- *Human Health Risk Assessment Note Number 1 – Recommended DTSC Default Exposure Factors for Use in Risk Assessment at California Hazardous Waste Sites and Permitted Facilities* (DTSC 2019a)
- *Human Health Risk Assessment Note Number 2 - Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites* (DTSC 2017)
- *Human Health Risk Assessment Note Number 3 – DTSC Recommended Methodology for Use of U.S. EPA Regional Screening Levels (RSLs) in Human Health Risk Assessment Process at Hazardous Waste Sites and Permitted Facilities* (DTSC 2022a)
- *Human Health Risk Assessment Note Number 4 – Guidance for Screening Level Human Health Risk Assessments* (DTSC 2022b)

The HHRA framework consists of the following four basic steps (EPA 1989):

1) Data Evaluation: The first step consists of reviewing and evaluating available data, identifying COPCs in media at each site.
2) Exposure Assessment: The second step involves evaluating potential exposure pathways for COPCs and the potential human populations that could be exposed to them, either now or in the future. Exposure point concentrations (EPCs) are estimated from measured or modeled concentrations, and pathway-specific exposure parameters and assumptions are evaluated.
3) Toxicity Assessment: The third step comprises compiling toxicity values that characterize potential adverse health effects from exposure to COPCs and are used to estimate potential risks to human health.
4) Risk Characterization: The fourth step combines the results of the previous three steps to quantitatively characterize potential risks to human health associated with exposure to COPCs at the RECs evaluated. Potential cancer risk and adverse noncancer health effects are estimated. Uncertainties in risk characterization are discussed.

Each step is described in the following sections.

3.1.1 Data Evaluation

Before conducting the risk assessment, the analytical results from sampling (Appendix D) were validated in a data quality evaluation report (Appendix E). The suitability of the analytical results was then evaluated for use in the risk assessment. The following data reduction steps were taken:

- Estimated values (flagged with "J" qualifiers) were treated as detected concentrations.
- For PAH analysis, where Methods SW8270C and SW8270SIM were both used, the selective ion monitoring (SIM) (low-detection limit) results were retained. SIM methodology allows for high accuracy of identification while the signal-to-noise ratio is much lower than a full-list scan, which allows for higher sensitivity within the SIM method.
- For naphthalene analysis, where Methods SW8270C and SW8260B were both used, the greater detected result was retained. If there were two nondetections, the result having the lower detection limit was retained (EPA 1989).
- Native and duplicate (field duplicates) sample pairs were reduced as follows:
  - If there were two detections, the greater of the two concentrations was used.
  - If there was one detection and one nondetection, the detected value was used.
  - If there were two nondetections, the result having the lower detection limit was used.

The data evaluation step includes the selection of human health COPCs that were included in the HHRA. Human health COPCs were identified based on an initial screening evaluation through which maximum detected concentrations (MDCs) for each analyte were compared to conservative screening levels for soil and groundwater. The risk-based screening levels used to select human health COPCs are based on human health exposure (for carcinogenic and noncarcinogenic constituents) for a residential exposure scenario based on the following hierarchy:

1. DTSC Human Health Risk Assessment Note 3 value for residential soil and tapwater (DTSC 2022a, Tables 1 and 2). Carcinogenic screening levels are based on a target cancer risk of 1×10^{-6}. Noncarcinogenic screening levels are the Note 3 values divided by 10 (for a hazard quotient [HQ] of 0.1).
2. EPA RSL for residential soil and tapwater based on target cancer risk of 1×10^{-6} and target noncancer hazard of 0.1 (EPA 2022a).
3. For petroleum hydrocarbons, San Francisco Regional Water Quality Control Board (SFRWQCB) screening levels for residential land use (SFRWQCB 2019, Table S-1 for soil and Table GW-1 for groundwater) divided by 10 (for a HQ of 0.1).

The COPCs (Appendix F) that were included in the HHRA for each site include analytes that exceed the residential risk-based screening levels and exceed background values, if available.

3.1.2 Exposure Assessment

Potential exposure pathways are based on current and potential future land uses for each REC (Table 1-1). RECs with passive recreation and natural habitat future uses are currently unoccupied and there are no buildings located onsite. Because these RECs are situated in a remote location with limited accessibility and the land will eventually be conveyed to the State of California for conservation purposes, future development is not likely. Potential future receptors are recreational users and construction workers. Although not considered to be a potential future land use, a hypothetical residential scenario was considered for risk management purposes (i.e., unrestricted land use).

Potential risks to human health for future recreational and construction worker exposure scenarios and the hypothetical future residential scenario were evaluated for each REC. The following pathways are assumed to be potentially complete:

- Future recreational users could potentially be exposed to surface soil, defined as 0 foot to 2 feet below ground surface (bgs), and mixed-zone soils (0 foot to 10 feet bgs), which hypothetically assumes subsurface soil is brought to the surface in the future (e.g., excavation during construction projects). Potentially complete routes of exposure to mixed-zone soil include incidental ingestion, dermal contact, and inhalation of suspended particulates (dust) and vapors volatilizing from the soil surface to air.
- Future construction workers could potentially be exposed during construction activities (e.g., excavation) to surface soil and mixed-zone soils through incidental ingestion, dermal contact, and inhalation of suspended soil particulates (dust) and vapors volatilizing from the soil surface to air. At the Copco No. 2 Wood-Stave Penstock, future construction workers could potentially be exposed during construction activities to shallow water through dermal contact.
- Hypothetical future residents could potentially be exposed to surface soil and mixed-zone soils. Potentially complete routes of exposure to soil include incidental ingestion, dermal contact, and inhalation of suspended soil particulates (dust) and vapors volatilizing from the soil surface to air. Hypothetical future residents could potentially be exposed to tapwater use of groundwater. Potentially complete routes of exposure to groundwater would include ingestion, dermal contact, and inhalation during household activities.

An exposure area describes a location or area where humans might encounter one or more contaminated environmental media on a regular basis. Because of the small size of the RECs, each REC was evaluated as its own exposure area.

3.1.2.1 Exposure Point Concentrations

Data were compiled for each media and for each soil depth interval within the exposure area for the respective sites to estimate EPCs, which are the COPC concentrations considered representative of what potential receptors might be exposed to over time.

The EPCs for soil were calculated for each COPC and depth interval (surface soil and mixed-zone soil) evaluated. The data from a depth interval were grouped to calculate an upper-bound average concentration for each COPC, which was used in the risk calculations as the EPC. For data sets that have sufficient data points, a 95 percent upper confidence limit (UCL) on the mean was calculated for each COPC in soil using the latest version of EPA's ProUCL software, version 5.2 (EPA 2022b, 2022c). Treatment of nondetections in the derivation of the EPC were addressed by the ProUCL software, which evaluates several estimation methods, including Kaplan-Meier, regression on order statistics and substitution methods (where the nondetect value is replaced by the limit of detection). Additionally, skewed data sets (including left-censored data sets with nondetect observations) can be adjusted by the ProUCL software using gamma, lognormal distribution, and nonparametric methods to calculate a UCL. ProUCL input and output are provided in Appendix F.

Maximum concentrations are used as the EPCs where the data exhibit high variance, the sample size is fewer than five, there are fewer than four detected values, or the 95 percent UCL is greater than the maximum concentration (EPA 2016a). In cases where there are fewer than four detected values, the mean value may be selected in accordance with EPA (2016a) guidance regarding EPCs. EPCs for COPCs in groundwater are the maximum detected concentrations.

3.1.2.2 Exposure Parameters

For the hypothetical residential exposure scenario, DTSC- and EPA-published default reasonable maximum exposure parameters (DTSC 2019; EPA 2014) were used in the risk estimate calculations (Table 3-1).

For the future passive recreational user exposure scenario, EPA (2014) default exposure assumptions for a resident were used (Appendix F) with the following modifications:

- Exposure frequency: 3 weeks per year (conservative estimate for a site camper)
- Exposure duration: 10 years (conservative estimate of number of years a camper might visit site)

For the future active recreational user exposure scenario, EPA (2014) default exposure assumptions for a resident were used with the following modifications:

- Exposure frequency: 2 hours per day, 5 days per week, and 12 weeks per year (conservative estimate for a fisherman launching a boat at the Copco No. 2 Powerhouse)
- Exposure duration: 10 years (conservative estimate of number of years a fisherman might visit site)

For the future construction worker exposure scenario, EPA (2014) default exposure assumptions (Table 3-1) were used, and conservative site-specific parameters presented for each REC.

3.1.3 Toxicity Assessment

The following DTSC (DTSC 2019b, 2022a) and EPA-recommended (EPA 2003, 2013; ECOS 2007) toxicity value selection hierarchy was used in the risk assessment for soil and groundwater:

- DTSC Human Health Risk Assessment Note 10 (DTSC 2019b)
- EPA Integrated Risk Information System (IRIS) toxicity values (EPA 2021, 2022a)
- EPA Provisional Peer-Reviewed Toxicity Values (PPRTVs) (EPA 2022a)
- Other toxicity values listed in EPA RSL tables (EPA 2022a)

For chemicals not listed in DTSC Note 10, the toxicity values listed in the most current RSL tables (EPA 2022a) were used, as the toxicity hierarchy vetted and used by the EPA to develop the RSL tables corresponds with the hierarchy listed in the second through fourth bullets presented in this section.

For the construction worker exposure scenario, subchronic noncancer toxicity values were used if available (EPA 2022b).

Surrogate chemicals were selected for toxicity values (for COPCs without toxicity values) based on structural similarity, chemical activity, and mechanisms of toxicity. Surrogate chemicals are discussed in the site-specific risk assessments.

3.1.3.1 Dioxins

Risk for dioxins and dioxin-like compounds were evaluated in accordance with DTSC guidance (DTSC 2017) using dioxin toxicity equivalency factors to calculate a 2,3,7,8-Tetrachlorodibenzo-P-dioxin (2,3,7,8-TCDD) toxic equivalent (TEQ) concentration. Toxicity values for 2,3,7,8-TCDD were used for the calculated 2,3,7,8-TCDD TEQ concentrations (DTSC 2017).

3.1.3.2 Total Petroleum Hydrocarbons

Total petroleum hydrocarbons were evaluated in general accordance with DTSC guidance (DTSC 2021). The following surrogate toxicity values were used for diesel range organics (DROs) based on EPA PPRTVs (EPA 2009):

- Oral reference dose = 0.1 milligram per kilogram per day (mg/kg-day) for aliphatic fractions based on aliphatic hydrocarbon streams within the C9–C18 range (hydrocarbons with 9 to 18 carbon atoms) and containing less than 0.5 percent aromatics (EPA 2009; TPHCWG 1997).
- Reference concentration = 1.0 milligram per cubic meter (mg/m^3) for aliphatic fractions based on aliphatic hydrocarbon streams within the C9–C18 range and containing less than 0.5 percent aromatics (EPA 2009; TPHCWG 1997).
- Aromatic compounds are evaluated with benzene, toluene, ethylbenzene, and xylene (BTEX) and PAH data.

3.1.3.3 Mutagenic Chemicals

Chemicals with mutagenic mode of action were evaluated using EPA (2014) default age-dependent adjustment factors:

- 10-fold adjustment for 0 to less than 2 years
- 3-fold adjustment for 2 to less than 16 years
- No adjustment for 16 years or greater

3.1.4 Risk Characterization

3.1.4.1 Risk-based Concentrations

Site-specific carcinogenic and noncarcinogenic risk-based concentrations (RBCs) were derived for the COPCs identified using the EPA RSL calculator (EPA 2022e) with site-specific inputs and DTSC toxicity values if available. The RBCs were used to calculate the risk estimates. The RBC (Appendix F) for each COPC is based on a target noncancer HQ of 1 and a target cancer risk estimate of 1×10^{-6}. The RBCs were derived based on the exposure equations and toxicity value selection hierarchies presented, using EPA exposure equations presented in RSL User's Guide (EPA 2022b) consistent with EPA and DTSC guidance (EPA 2014; DTSC 2019).

3.1.4.2 Cancer Risk and Noncancer Hazard Estimates

For soil and groundwater, risks and hazards were calculated for each exposure scenario. Cancer risk and noncancer hazards were calculated using the following equations:

$$\text{Cancer Risk} = \text{EPC} \times \text{TRL} / \text{RBCc}$$

$$\text{HQ} = \text{EPC} \times \text{THQ} / \text{RBCnc}$$

Where:

Cancer Risk = chemical-specific cancer risk estimate (unitless)

TRL = target cancer risk level used in the derivation of the RBCc, 1×10^{-6} (or 1E-06) (unitless)

RBCc = risk-based concentrations for cancer effects (milligram per kilogram [mg/kg] for soil, microgram per liter [µg/L] for groundwater)

HQ = chemical-specific noncancer hazard quotient estimate (unitless)

THQ = target HQ used in the derivation of the RBCnc, 1 (unitless)

RBCnc = risk-based concentrations for noncancer effects (mg/kg for soil, µg/L for groundwater)

EPC = exposure point concentration (mg/kg for soil, µg/L for groundwater)

For each receptor, the risk estimates were summed to generate cumulative risk estimates using the following equations:

Total Excess Lifetime Cancer Risk (ELCR) Estimate = Sum of Cancer Risk Estimates for COPCs

Total Noncancer Hazard Index (HI) Estimate = Sum of Noncancer HQs for COPCs

A primary contributor to carcinogenic risk or noncancer hazard was identified if a COPC has a cancer risk exceeding 1×10^{-6} or a HQ exceeding 1. Primary contributors also include COPCs that most substantially contribute to a HI greater than 1 where the individual HQs are less than 1. Primary contributors to risk are evaluated for required action in the site-specific risk assessments.

3.1.4.3 Evaluation of Lead

Risk from exposure to lead is assessed differently than intake of other chemicals (DTSC 2022b; EPA 2016b). Much of the toxicological data collected on the effects of lead on the human body relate exposure and effect in terms of the amount of lead in blood associated with an observed effect, expressed as micrograms of lead per deciliter of blood.

Potential risks associated with exposure to lead in soil were evaluated by comparing the lead EPCs to the DTSC Note 3 values (DTSC 2022a) for lead in soil. The residential Note 3 value was used for recreational user and hypothetical future residential exposure scenarios, and the industrial Note 3 value was used for the construction worker exposure scenarios.

3.1.5 Uncertainty Discussion

A number of uncertainties are inherent in the estimates of potential cancer risks and noncancer health hazards that are presented in a HHRA. Uncertainties are generally associated with the sampling strategy and site characterization process, or the assumptions and models that make up the risk assessment process. The potential effect of the uncertainties on risk estimates (i.e., overestimation or underestimation) varies from effects that are readily predicted to those that are difficult to assess. Possible uncertainties associated with each of the four steps of the HHRA (data evaluation, exposure assessment, toxicity assessment, and risk characterization) were considered. Site-specific uncertainties for each site are discussed in Sections 5 through 12.

The estimation of exposure requires many assumptions to describe potential exposure situations. There are uncertainties regarding the likelihood of exposure, frequency of contact with contaminated media, the concentration of COPCs at exposure points, and the duration and period of exposure. In general, these assumptions are upper-bound assumptions, intended to be conservative, and yield an overestimate of the true risk or hazard.

Use of the residential Note 3 value for lead to evaluate a recreational scenario is conservative and overestimates the risk to recreational users who have significantly lower exposure frequencies and exposure durations than a potential resident.

As presented in the California SIWP (Jacobs 2021a), some analytes were expected to have method detection limits (MDLs) that exceeded the screening levels because of laboratory analytical method limitations. Generally, the absence of these nondetected analytes with MDLs greater than the screening levels is supported by the site's operational history.

3.2 Leaching to Groundwater Evaluation

The leaching to groundwater evaluation assesses the attenuation that will occur as a constituent leaches from soil above groundwater into groundwater. COPCs for the potential leaching to groundwater pathway are the chemicals in soil with MDCs exceeding the soil leaching screening levels. These screening levels are the SFRWQCB environmental screening levels designed to be protective of groundwater as a drinking water resource (SFRWQCB 2019, Table S-3). The screening levels are conservative because none of the sites are expected to be used as sources of drinking water, and exceedances do not necessarily mean the groundwater will be impacted. Factors and uncertainties concerning the potential for soil contamination to migrate to groundwater include depth to groundwater, site lithology, organic carbon content of soil, rainfall amounts, and infiltration rates.

Evaluation of groundwater as a drinking water resource is provided for risk management purposes. Because potable use of groundwater at the sites is not a future use, soil leaching values protective of groundwater as a nondrinking water resource were considered (SFRWQCB 2019, Table S-3). Soil leaching values for protection of freshwater habitat were evaluated for COPCs at each site. The other SFRWQCB nondrinking water targets, including protection of saltwater habitat and protection of vapor intrusion into indoor air, are not applicable to the sites and were not evaluated.

The SFRWQCB calculates soil leaching screening levels based on the following equation (SFRWQCB 2019):

$$C_{soil}\ (mg/kg) = C_{water}\ (\mu g/L) * DAF * 0.001\ (mg/\mu g)$$

Where:

C_{soil} = Soil Leaching Screening Level Concentration (mg/kg)

C_{water} = Target Groundwater Concentration (µg/L)

DAF = Dilution Attenuation Factor (unitless)

The DAF is calculated based on the following modeled equation (SFRWQCB 2019):

$$DAF = (6207 \times H) + (0.166 \times Koc)$$

Where:

H = Henry's Law Constant (atmospheres cubic meter per mole, atm-m^3/mol)

Koc = organic carbon partition coefficient (cubic centimeter per gram, cm^3/g)

The potential for a complete migration to groundwater pathway is also evaluated by considering whether COPCs have migrated from historical surface releases, if contamination is delineated laterally and vertically, and how contaminant depths compare with estimated or measured depths to groundwater.

3.3 Ecological Risk Assessment

A streamlined ecological risk assessment (ERA) was completed for each site to evaluate potential risks to ecological receptors from contaminants in soils under current and potential future land use conditions. The results of the streamlined ERA will be used in conjunction with the HHRA and leaching to groundwater evaluation (discussed in Sections 3.1 and 3.2, respectively) to provide risk managers with information needed to support risk management decisions.

The streamlined ERAs were performed in general accordance with EPA and DTSC guidance as follows:

- *The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (EPA 2001)
- *Guidelines for Ecological Risk Assessment* (EPA 1998)
- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (EPA 1997)
- *Guidance for Ecological Risk Assessment at Hazardous Waste Sites and Permitted Facilities* (DTSC 1996)

The streamlined ERAs were conducted in a phased approach as follows (Figure 3-1):

- Step 1 – Screening Evaluation: The screening evaluation consists of a very conservative (i.e., protective of the most sensitive ecological receptors) screen of sample-specific detected results for the site compared to available background threshold values (BTVs) and the No Effect Ecological Screening Level (No Effect ESL). Chemicals with observed concentrations that do not exceed the No Effect ESLs are considered to not pose a potential risk to ecological receptors and are eliminated from further evaluation. Chemicals with detected concentrations exceeding the No Effect ESLs are carried forward to Step 2 (Refined Evaluation).
- Step 2 – Refined Evaluation: The refined evaluation consists of a comparison of sample-specific results against a refined screening level that is based on a lowest observed adverse effect level (LOAEL) for wildlife. The chemicals with observed concentrations that do not exceed the Low Effect ESL are considered to not pose a significant risk to ecological receptors. Chemicals with detections exceeding the Low Effect ESL are carried forward to Step 3 (Site-Specific Evaluation).
- Step 3 – Site-Specific Evaluation: The site-specific evaluation consists of a comparison of sample-specific detected results against site-specific ecological preliminary remedial goals (EcoPRGs) developed for avian and mammalian receptors that may potentially be found at the sites (see Section 3.3.4 for details). Chemicals with observed concentrations exceeding the EcoRPGs are carried forward to Step 4 (Weight of Evidence Evaluation).
- Step 4 – Weight of Evidence Evaluation: The weight of evidence evaluates multiple lines of qualitative and quantitative evidence to place the potential risks into context of site-specific conditions. These lines of evidence include the results from Steps 1 through 3, comparisons to regional background concentrations, potential for ecological receptors to use the site, available habitat, and expected future use of the site. The results of the weight of evidence evaluation are used to inform risk managers of chemicals considered to pose a potential risk to ecological receptors so that remedial decisions can be made for the site.

The streamlined ERAs were conducted under the following assumptions and constraints. These are typical for ERAs performed for both public and private entities:

- Evaluation of current exposures is derived from existing conditions.
- The abiotic medium of primary ecological concern is soil.
- Measured chemical concentrations are assumed to be at steady-state levels.
- Chemicals never detected or not analyzed for in soil samples are not evaluated.
- Each chemical measured in collected samples is considered to have similar bioavailability as the chemical form used in the toxicity studies that are used to estimate potential for risk.
- Toxicological information used represents information currently available from literature and database searches.

3.3.1 Ecological Conceptual Site Model

The ecological conceptual site model combines information on potential sources of contaminants, ecological exposure pathways, and potential ecological receptors to provide an overall picture of site-related exposures and to focus the evaluation of chemical constituents in this streamlined ERA.

The known site history for each of the sites, physical setting, and biological resources are presented in the California SIWP (Jacobs 2021a) along with the potential future uses of each site and potential exposure pathways. The sites evaluated in this California SI Report are summarized in Appendix G, Table G-1.

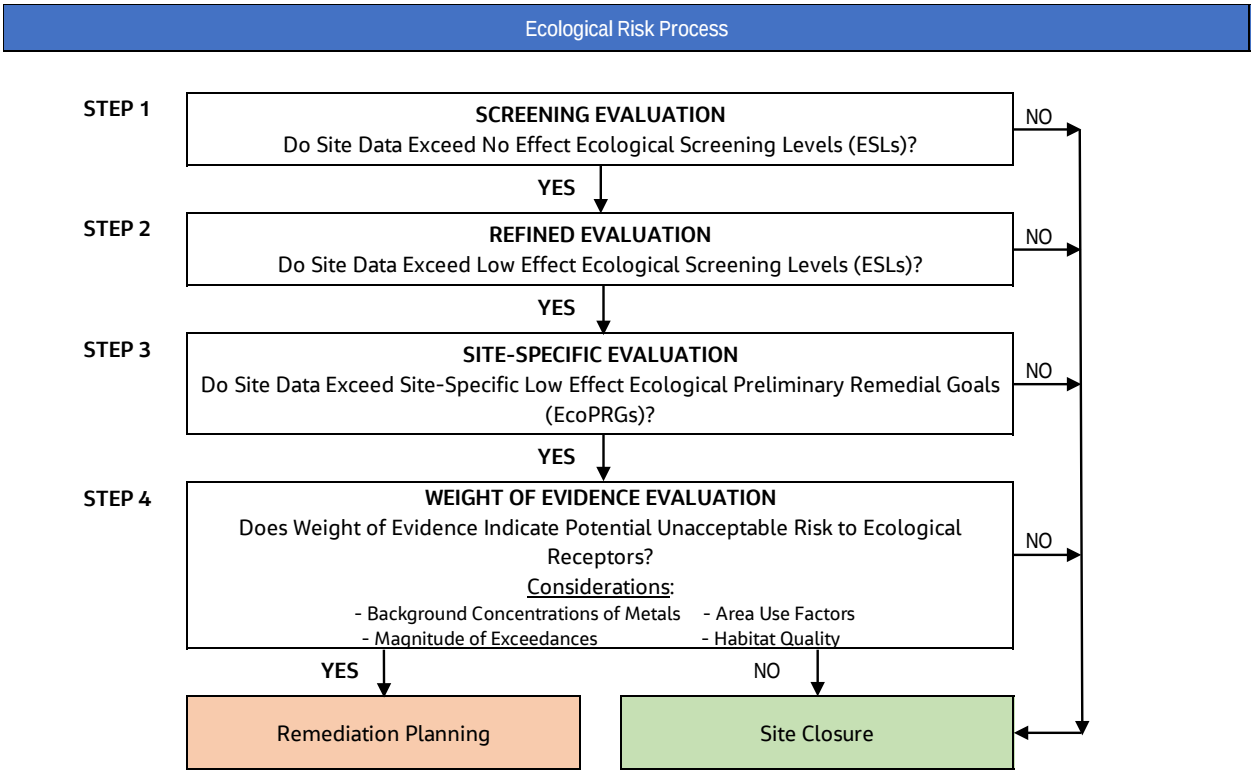

Figure 3-1. Ecological Risk Assessment Process

Potential contaminants include metals, dioxin/furans, PAHs, PCBs, TPHs, semivolatile organic compounds (SVOCs), and VOCs. The primary impacted media are soils. Release and transport mechanisms may include

erosion and surface runoff; infiltration and leaching to groundwater; volatilization, weathering, and/or erosion into soil vapor and ambient air.

Based on review of existing information, the following exposure pathways are considered potentially complete and are evaluated quantitatively under current or potential future land uses:

- Potential exposure to soil from 0 to 1 foot bgs is considered a potentially complete exposure pathway for terrestrial receptors, including terrestrial plants, soil invertebrates, birds, and mammals.
- Potential exposure to soil from 0 foot to 6 feet bgs is considered a potentially complete exposure pathway for burrowing wildlife.
- Potential exposure to onsite groundwater is considered incomplete as depth to groundwater exceeds exposure depths for terrestrial plants (4 feet bgs).

Receptor groups that have the potential for exposure at each site include terrestrial plants, soil invertebrates, birds, and mammals. For purposes of the streamlined ERAs, each site is evaluated as a single exposure area unless otherwise noted. Implicit in the exposure area concept is the assumption that the receptor has equal likelihood of exposure to contamination at any individual location within the identified exposure area.

Site ecological evaluation data are provided in Appendix G. All data collected from 0 foot to 6 feet bgs that met data validation requirements were included in the streamlined ERA including both native and field duplicates. All evaluations in the streamlined ERA are completed on a sample-by-sample basis.

3.3.2 Step 1 – Screening Evaluation

The Screening Evaluation is a conservative estimate of potential risks. The exposure assumptions are the most conservative because risk estimates are completed on a sample-by-sample basis, it is assumed that ecological receptors spend 100 percent of their time (area use factor [AUF] of 1) at that location, and comparisons are against the most conservative (i.e., smallest) toxicity criteria as well as regional background concentrations.

The ESLs used in the screening evaluation are based on No Effect levels, are intended to be protective of all ecological receptors exposed to soil and are widely accepted values available from agencies or peer-reviewed literature sources. No Effect ESLs used in Step 1 were selected from the following sources in hierarchical order:

1. EPA ecological soil screening levels (EcoSSLs) (EPA 2008)
2. Los Alamos National Laboratory (LANL 2020)
3. EPA Region 4 soil screening values (EPA 2018)

Each of the above sources include soil ESLs for plants, soil invertebrates, birds, and mammals. The most conservative (i.e., smallest) ESL from among these terrestrial receptor groups was selected from that source where it appears in the overall hierarchy. The selected No Effect ESLs are summarized in Appendix G, Table G-2 for analytes evaluated as part of this investigation.

Analytes were retained for further evaluation in Step 2 (Refined Evaluation) if at least one detected concentration exceeded the No Effect ESL. In addition, all analytes retained for further evaluation in Step 2 are also included in Step 4 (Weight of Evidence Evaluation). If the detected concentration did not exceed the No Effect ESL, there is high degree of confidence that the risks to ecological receptors are acceptable given the conservative assumptions used.

3.3.3 Step 2 – Refined Evaluation

The Refined Evaluation provides additional information on potential risks for ecological receptors. The refined evaluation remains an overly conservative evaluation because it is still conducted on a sample-by-sample basis assuming 100 percent site use. The only difference from the Step 1 Screening Evaluation is that a Low Effect ESL is used instead of the No Effect ESL.

The Low Effect ESLs are based on LOAELs and are indicative of a level above which potential adverse effects may be observed in some local populations of wildlife (birds and mammals). Low Effect ESLs for birds and mammals because risk management decisions are made on these receptor groups. The soil Low Effect ESLs were obtained from LANL (2020) and are generally the most conservative value between birds and mammals across all feeding guilds including herbivores, insectivores, omnivores, and carnivores. For the cases where the most conservative Low Effect ESL is lower than the No Effect ESL, the most conservative Low Effect ESL that is greater than the bird or mammal No Effect ESL was selected. This condition may occur when multiple sources and receptor groups are used to identify a single screening level. The only instance where this deviation from the standard hierarchy occurred in this analysis was in the selection of the Low Effect ESL for nickel. The most conservative Low Effect ESL for nickel from LANL (2020) was more conservative than the most conservative No Effect ESL for nickel from EPA (2008). In this instance the smallest Low Effect ESL for nickel from LANL that was greater than the EPA No Effect ESL was selected.

Analytes were retained for further evaluation in Step 3 if the detected concentration exceeded the Low Effect ESL. If the detected concentration does not exceed the Low Effect ESL, there is high degree of confidence that the risks to ecological receptors are acceptable because of the conservative assumptions used; however, all analytes evaluated in Step 2 are also included in the weight of evidence evaluation (Step 4) so that both qualitative and quantitative information can be considered in the recommendations for risk management.

3.3.4 Step 3 – Site-Specific Evaluation

The Site-Specific Evaluation includes multiple refinements to further evaluate potential risks and reduce uncertainties. Sites with analytes retained after Step 2 may be evaluated with one or more of these refinements depending on the analytes and results of previous steps:

- Representative species indicative of the ecological setting around the site are identified and species-specific life history parameters are used to calculate site-specific EcoPRGs.
- Low Effect EcoPRGs are developed for birds and mammals to provide a range of potential risk estimates.
- Risk estimates are completed in a stepwise manner so that contributions from soil versus diet are more readily observed and exposure pathways that may be driving risk can be identified.
- Species-specific home ranges may be used to calculate an AUF for the site that is then applied to the risk estimate to provide a more realistic estimate of potential exposure.
- Site data for metals are compared to regional BTVs to estimate the potential risk resulting from site activity versus natural background levels.
- All analytes evaluated in Step 3 are carried forward to Step 4 (Weight of Evidence Evaluation).

Specific representative species were not identified in Step 1 or Step 2; rather all functional groups were evaluated (i.e., terrestrial plants, soil invertebrates, birds, and mammals) together using the most conservative assumptions for all receptors. To evaluate ecological exposure for smaller subsets of wildlife, representative species are selected for the primary functional feeding guilds that may have potentially

complete exposure pathways. Consistent with *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (EPA 1997), representative species are preferably those that have ecological relevance, are of societal value, and are susceptible to chemical stressors at the site. These factors were used to select representative species that have been observed or are expected to occur at the site and meet one or more of the following criteria:

- Receptor occurs in the general area and habitat is available onsite to support the receptor.
- Receptor has a small home range.
- Receptor is representative of a feeding guild.

Representative species identified for the RECs include the following:

- Herbivores: Mourning dove (*Zenaida macroura*), deer mouse (*Peromyscus maniculatus*)
- Invertivore: Hermit thrush (*Catharus guttatus*), vagrant shrew (*Sorex vagrans*)
- Carnivores: Red-tailed hawk (*Buteo jamaicensis*), coyote (*Canis latrans*)

3.3.4.1 Derivation of Site-Specific EcoPRGs

EcoPRGs are species-specific RBCs of chemicals in soil that correspond to reported effect levels for a given species and are reported in mg/kg. The EcoPRGs were derived for each of the selected representative species using a food-chain uptake model that accounts for the transfer of chemicals to upper trophic levels (birds and mammals) through the incidental ingestion of soil and ingestion of food (forage or prey) that has accumulated chemicals from the site. The derivation model for EcoPRGs follows the generalized food chain uptake model from Sample et.al (2000) and is shown below. The major inputs to the equation are described below and include toxicity reference values (TRVs), food ingestion rates (FIR), dietary composition (Pi), and proportion of diet that is soil (Ps). Supporting tables and calculations are included in Appendix G.

$$EcoPRG = \frac{TRV}{[Ps \bullet FIR] + [\sum_{i=1}^{N} Bi \bullet Pi \bullet FIR]}$$

$$Where:$$
$$B_i = [Soil] \bullet BAF$$

Where:

EcoPRG	=	ecological preliminary remedial goal in soil (mg/kg)
TRV	=	no effect or low effect toxicity reference value (mg/kg body weight per day)
P_s	=	proportion of diet that is soil (unitless)
FIR	=	food ingestion rate normalized to body weight (kg/kg body weight per day)
B_i	=	concentration of chemical in biota type (i) (mg/kg)
P_i	=	proportion of diet that is biota type (i)
BAF	=	bioaccumulation factor (dry weight)
[Soil]	=	concentration of the analyte in soil

Toxicity Reference Values (TRVs) – TRVs for birds and mammals are represented as a dosage (the amount of an analyte per unit body weight per day) that has been reported to result in an adverse effect. The TRVs for birds and mammals were selected using the following hierarchy of sources and are presented in Appendix G, Table G-3 (birds) and Table G-4 (mammals) for chemicals retained for further evaluation in the site-specific evaluation:

1. Recommended no observed adverse effect level (NOAEL) TRVs and derived LOAEL-based TRVs from the EPA EcoSSL documentation (EPA 2005a, 2005b; EPA 2007b, 2007c; EPA 2008)
2. Toxicological benchmarks for wildlife (Sample et al. 1996)

3. NOAEL and LOAEL TRVs from LANL (2020)
4. Other peer-reviewed literature (cited as appropriate)

TRVs are classified into two categories: No Effect TRVs and Low Effect TRVs. The No Effect TRVs are based on the chronic NOAEL and reflect the highest exposure that has been demonstrated to exert no adverse effect. The Low Effect TRVs are based on the chronic LOAEL and reflect exposure that has been demonstrated to exert an adverse effect.

For analytes with information in USEPA's EcoSSL documentation (sources in item 1 above), the NOAEL TRV that was used to derive the final EcoSSL was selected if it had the highest level of confidence over other available values. In addition, LOAEL toxicity results for growth and reproduction studies were used to derive a geometric mean LOAEL TRV.

For analytes without EPA EcoSSLs (sources in item 1 above), appropriate toxicity studies from peer-reviewed literature were selected based on several criteria. Specifically, toxicity studies were selected for use if exposure was chronic or during reproduction (a critical life stage), the dosing regime was sufficient to identify both a NOAEL and a LOAEL, and the study considered ecologically relevant effects (for example, growth or reproduction). Literature-derived TRVs are adjusted through use of uncertainty factors (where applicable) to derive a final chronic No Effect TRV and chronic Low Effect TRV.

Receptor Exposure Factors – Species-specific life history factors are used to estimate the exposure to chemicals for each of the representative species selected for the site. These include body weight; food ingestion rate (FIR); proportions of the receptors diet (Pi) composed of plants, invertebrates, or mammals; and fraction of diet composed of incidental soil ingestion (Ps). Exposure factors and allometric equations to estimate FIRs were obtained from the literature.

Bioaccumulation Factors (BAFs) – The measurement or estimation of concentrations of chemicals in wildlife food is necessary to evaluate how much of a receptor's exposure is through food versus direct uptake of contaminated media. Although the preferred data are direct measurements of concentrations in biota samples collected from the site, such data were not available for the Project. Therefore, literature-reported values or uptake models are used to estimate bioaccumulation. BAFs and regression models were obtained from the EcoSSL documentation (EPA 2007a), Sample et al. (1998a, 1998b), LANL (2020), Bechtel-Jacobs (1998), and Baes et al. (1984). A default BAF of 1 was used in the absence of reliable values. BAFs and regression models for analytes retained for further evaluation in the site-specific evaluation are presented in Appendix G, Table G-5.

EcoPRGs – No Effect EcoPRGs and Low Effect PRGs were developed for those analytes that had exceedances of the Low Effect ESL in Step 2 and are presented in Appendix G, Table G-6. The most conservative EcoPRG for birds and the most conservative EcoPRG for mammals were used to estimate potential risks in the site-specific evaluation and are shown in the screening-level summary table (Appendix G, Table G-2).

3.3.4.2 Site-Specific Risk Estimation

The site-specific risk estimates were calculated using the No Effect and Low Effect EcoPRGs as follows:

$$HQ = \frac{[Soil]}{EcoPRG}\ x\ AUF$$

Where:

HQ	=	hazard quotient (unitless)
[Soil]	=	sample-specific concentration of analyte in soil (mg/kg)
EcoPRG	=	ecological preliminary remedial goal in soil (mg/kg)
AUF	=	area use factor

EcoPRG – The most conservative bird and mammalian No Effect EcoPRG or Low Effect EcoPRG. All EcoPRGs are presented in Appendix G, Table G-6 and the most conservative values that are used in the risk estimation are summarized in Appendix G, Table G-2.

Area Use Factors – Many wildlife species are highly mobile, covering relatively large areas in search of food, water, and shelter. As such, the exposure that individual receptors experience depends on the amount of time they spend in the exposure area. The species-specific AUF is calculated by dividing the exposure area (acres) by the foraging range (acres) of the receptor. If the foraging range is smaller than the exposure area, the AUF defaults to 1. The AUFs for each site are presented in Appendix G, Table G-7.

The site-specific risk estimates were calculated using the Low Effect EcoPRGs and AUFs for hermit thrush and vagrant shrew as these were the receptors with the most conservative EcoPRGs for the analytes retained for further evaluation in Step 3. The risk estimates were completed both with and without the application of the receptor/site-specific AUFs. The risk estimations for each site are presented in Appendix G, Table G-9 through Table G-17.

In addition, sample-specific HIs were computed for groups of chemicals that were retained for evaluation in Step 3 including low molecular weight PAHs, high molecular weight PAHs, and Aroclors. The sample-specific Low Effect HI was computed by summing the Low Effect HQs for each detected analyte within the chemical group. The sample-specific Low Effect HQs were computed using the most conservative Low Effect EcoPRG between birds and mammals or the Low Effect ESLs from Step 2 if an EcoPRG was not developed for a given analyte. All Low Effect ESLs and EcoPRGs are shown in Appendix G, Table G-2. The sample-specific HIs were computed both with and without application of the most conservative receptor AUFs for each site. The sample-specific HIs are shown for all sites in Appendix G, Table G-18.

3.3.5 Step 4 – Weight of Evidence Evaluation

Not all the site risk estimates with HQs exceeding 1 are ultimately ecologically meaningful. The weight of evidence component (Step 4 of the streamlined ERA) is an evaluation of the lines of evidence supporting or refuting the risk estimates and an interpretation of the significance of the adverse effects on the identified assessment endpoints. To provide confidence in any decision-making regarding risk to ecological resources at a site, potential effects to ecological receptors is assessed using an approach that considers multiple lines of evidence collectively, in accordance with EPA guidance in *Guidelines for Ecological Risk Assessment* (EPA 1998).

The following lines of evidence are considered where applicable for each exposure area and exposure media.

- Site risk estimates at the No Effect ESL and Low Effect ESL
- Site risk estimates using the No Effect EcoPRG and Low Effect EcoPRG (with and without application of the AUF)
- Sample-specific chemical group risk estimates using the Low Effect EcoPRG or Low Effect ESL (with and without application of the AUF)
- Comparison of site concentrations to background concentrations for metals

- AUFs
- Current and potential future land use and habitat quality
- Potential receptors/presence of federal or state threatened and endangered species
- Uncertainties and limitations

Results of Step 4 are used to provide recommendations for risk management or no further evaluation for ecological receptors. Step 4 results for each site are summarized in the site-specific sections in tabular format. Each chemical that was retained after Step 1 is presented in the site-specific summary tables along with a listing of the number of samples exceeding the No Effect ESL, Low Effect ESL, bird EcoPRG, mammal EcoPRG, and background concentrations. The weight of evidence evaluation is summarized into a letter code (specific to each site) for all chemicals with the same rationale to reduce redundancy in the text. The codes focus primarily on the quantitative elements however, the qualitative lines of evidence are also considered and are discussed as needed where they impact the final recommendation. Uncertainties and limitations that are standard in the practice of risk assessment are summarized in Appendix G, Table G-8.

Table 3-1. Exposure Assumptions for the Human Health Risk Assessment

Exposure Parameter	Symbol	Units	Future Construction Worker	Source	Hypothetical Future Resident	Source
Exposure Concentration (soil)	C_s	mg/kg	95% UCL or maximum	a	95% UCL or maximum	a
Exposure Concentration (groundwater)	C_w	µg/L	Maximum	a	Maximum	a

4. Copco No. 1 Dynamite Cave

This section describes the field activities and recommended next steps for closure of the Copco No. 1 Dynamite Cave, which was suspected to have formerly stored dynamite (AECOM 2018). Although PacifiCorp noted that any dynamite had likely been removed from the cave, the absence of explosives or explosive residue within the cave could not be confirmed. Consequently, the cave was included as a REC to be addressed under Exhibit C of the Agreement. Fieldwork to assess the cave was performed according to Section 3.4 (Copco No. 1 Dynamite Cave) of the California SIWP.

4.1 Field Activities

On March 2, 2022, a scaffold was erected and inspected to allow for safe entry to the cave and for removal of the wooden panels blocking the cave entrance. The cave was allowed to vent overnight and was accessed and inspected the following day by a qualified unexploded ordinance (UXO) technician. During the initial inspection, a vertical shaft was discovered at the back of the cave. The shaft was determined to extend more than 20 feet below the plywood flooring. On March 9, 2022, a video survey of the shaft was completed. Dynamite and residual explosives were not observed within the cave or at the bottom of the shaft in the cave (Appendix H).

4.2 Analytical Results

On March 3, 2022, the presence or absence of residual explosives within the cave was determined by a qualified UXO technician through the use of Expray #1 for Group A explosives, Expray #2 for Group B explosives, and Expray #3 for improvised explosives with nitrate. Swipe samples were collected from six representative locations of the cave's floor, from three representative locations of the cave's ceiling, and from three representative locations of each sidewall. All swipe sample locations tested negative for the presence of residual explosives.

4.3 Recommended Actions

Because no explosives or explosive residue were present in the cave, no additional fieldwork is planned, and the Copco No. 1 Dynamite Cave site is recommended for closure (Section 1.2).

5. Copco No. 1 Debris Pile/Scrap Yard

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Copco No. 1 Debris Pile/Scrap Yard.

5.1 Background

The *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020a) describes a scrap material laydown yard on a graded cinder borrow area located approximately one-quarter mile south of Copco Road and one-quarter mile northwest of the Copco No. 1 Dam. Soil at the site is generally classified as Lava flows-Xerorthents complex (USDA 2021).

For soil assessment purposes, the site was subdivided into four areas (Figure 5-1). Area 1, located on a hillside in the northern portion of the graded area, was found to contain piles of broken ceramic toilet bowls and seats with bullet holes. Area 2, located near the center of the graded area, was found to contain a burn pit with materials piled up to be burned (Photograph 5-1).

Photograph 5-1. Copco No. 1 Debris Pile/Scrap Yard Looking Southeast at Burn Pit (Jacobs 2021a)

Area 3, located in the southern portion of the graded area, was found to contain wood (some burned) and metal debris strewn over a large area (Photograph 5-2). Area 4, located on the downslope of the southern

edge of the graded area, was found to contain a pile of concrete footings, a small broken concrete box, and wood planks.

Also identified were the following:

- A scrap material storage area west of Area 3 and along the southern edge of the graded area. The scrap material storage area contains floating docks, walkways, corrugated metal culverts, and used building materials.
- In the southwest corner of the graded area, an embankment of gravel/soil, potentially used for grading and/or backfill.
- A small pile of ceramic electrical insulators on the western edge of the graded area.

The scrap material storage area, gravel/soil embankment, and pile of ceramic insulators were not found to contain materials with COPCs. The field team inspected these areas and did not observe signs of potential contamination or stressed vegetation. Consequently, soil samples were not collected in these areas.

Photograph 5-2. Copco No. 1 Debris Pile/Scrap Yard Looking East at Area of Strewn Burned Material and Direct-push Technology Rig (Jacobs 2022a)

5.2 Field Activities

On March 3, 2022, the planned soil borings for the Copco No. 1 Debris Pile/Scrap Yard were marked and cleared for utilities (Section 2). The visually impacted areas were delineated with a GPS unit. Select soil borings were moved to be better located within the visually impacted areas (Figure 5-1).

On March 10 and 11, 2022, 17 soil borings were advanced by hand augering and DPT drilling to depths of 2.5 or 6 feet bgs. Groundwater was not observed in any of the soil borings. Soil samples were collected from shallow and deep soil borings and at discrete intervals of varying depths (Table 5-1).

Table 5-1. Copco No. 1 Debris Pile/Scrap Yard Borehole Summary

Area	Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
1. Ceramic Toilet Bowls and Seats	C1DP-01	0-0.5, 1-1.5, 2-2.5	2.5	HA	About 6 feet up cinder slope
	C1DP-02	0-0.5, 1-1.5, 2-2.5	2.5	HA	About 5 feet up cinder slope
	C1DP-03	0-0.5, 1-1.5, 3-3.5, 5.5-6	6	HA/DPT	At base of cinder slope
2. Burn Pit	C1DP-04	0-0.5, 1-1.5, 2-2.5	2.5	HA	North edge of burn pit
	C1DP-05	0-0.5, 1-1.5, 2-2.5	2.5	HA	West edge of burn pit
	C1DP-06	0-0.5, 1-1.5, 3-4.5, 4.5-6	6	HA/DPT	Center of burn pit
3. Strewn Burned Material	C1DP-07	0-0.5, 1-1.5, 2-2.5	2.5	HA	--
	C1DP-08	0-0.5, 1-1.5, 2-2.5	2.5	HA	--
	C1DP-09	0-0.5, 1-1.5, 2-2.5	2.5	HA	Deep boring changed to C1DP-13
	C1DP-10	0-0.5, 1-1.5, 2-2.5	2.5	HA	--
	C1DP-11	0-0.5, 1-1.5, 2-2.5	2.5	HA	Deep boring changed to C1DP-14
	C1DP-12	0-0.5, 1-1.5, 2-2.5	2.5	HA	--
	C1DP-13	0-0.5, 1-1.5, 3-6	6	HA/DPT	Extended to 6 feet bgs
	C1DP-14	0-0.5, 1-1.5, 3-6	6	HA/DPT	Extended to 6 feet bgs
4. Concrete and Wood Planks	C1DP-15	0-0.5, 1-1.5, 3-6	6	HA/DPT	Extended to 6 feet bgs because C1DP-16 was inaccessible by DPT; top of slope
	C1DP-16	0-0.5, 1-1.5, 2-2.5	2.5	HA	Inaccessible by DPT; at base of lumber pile
	C1DP-17	0-0.5, 1-1.5, 2-2.5	2.5	HA	Next to concrete debris

Notes:
-- = no comment
bgs = below ground surface
DPT = direct-push technology
HA = hand auger

In Area 3, soil borings C1DP-09 and C1DP-11 were changed from deep to shallow borings, and soil borings C1DP-13 and C1DP-14 were changed from shallow to deep borings based on visual observations of potential burned material at surface grade in the vicinity of borings C1DP-13 and C1DP-14. In Area 4, soil boring C1DP-15 was changed from a shallow to a deep boring and soil boring C1DP-16 was changed from a deep to a shallow boring because the DPT rig could not access soil boring C1DP-16.

Site soils consisted of loose, fine to coarse sand and gravel-sized scoria and pumice rock. The loose, coarse-grained material resulted in poor hand auger recoveries at depths shallower than 2.5 feet bgs, and use of the DPT rig to advance soil borings to depths greater than 2.5 feet bgs typically resulted in pulverization of the loose volcanic rock into fine-grained material. Consequently, the planned sample intervals for some borings were altered to accommodate collection of a sufficient volume of material for laboratory analysis. At soil boring C1DP-06, the planned sample interval of 3.0-3.5 feet bgs was changed

to 3.0-4.5 feet bgs, and the planned sample interval of 5.5-6.0 feet bgs was changed to 4.5-6.0 feet bgs. At soil borings C1DP-13, C1DP-14, and C1DP-15, the deepest sample intervals (3.0-3.5 and 5.5-6.0 feet bgs) were combined into a single sample interval (3.0-6.0 feet bgs).

5.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for arsenic, cobalt, lead, and dioxins. Leaching to groundwater screening levels were exceeded for bis(2-chloroethyl) ether and naphthalene. Ecological screening levels were exceeded for dioxins and various metals (Table 5-2, Figure 5-1).

Table 5-2. Copco No. 1 Debris Pile/Scrap Yard Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Areas	Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
1. Ceramic Toilet Bowls and Seats	C1DP-01	<SLs	<SLs	Boron, Cobalt, Selenium
	C1DP-02	Cobalt	<SLs	Boron, Cobalt, Selenium
	C1DP-03	Cobalt	<SLs	Cobalt, Copper, Selenium
2. Burn Pit	C1DP-04	<SLs	<SLs	Dioxins, Cobalt, Copper, Selenium,
	C1DP-05	<SLs	<SLs	Dioxins, Cobalt, Copper, Selenium
	C1DP-06	Dioxins, Arsenic	Naphthalene	Dioxins, Arsenic, Boron, Cobalt, Copper, Selenium
3. Strewn Burned Material	C1DP-07	<SL	<SLs	<SLs
	C1DP-08	<SL	<SLs	Selenium
	C1DP-09	<SL	<SLs	Dioxins
	C1DP-10	<SL	<SLs	<SLs
	C1DP-11	<SL	<SLs	<SLs
	C1DP-12	<SL	<SLs	Molybdenum, Selenium
	C1DP-13	<SL	<SLs	Cobalt, Selenium
	C1DP-14	Lead	Naphthalene	Dioxins, Cobalt, Lead, Selenium
4. Concrete and Wood Planks	C1DP-15	Cobalt	<SLs	Cobalt, Selenium
	C1DP-16	<SL	Bis(2-chloroethyl) ether	Cobalt, Selenium
	C1DP-17	<SL	<SLs	Cobalt, Copper, Selenium

Notes:
SLs = screening levels
<SLs = does not exceed screening levels

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

5.4 Site-Specific Human Health Risk Assessment

5.4.1 Data Evaluation

The human health COPCs in soil at the Copco No. 1 Debris Pile/Scrap Yard are dioxins (2,3,7,8-TCDD TEQ), arsenic, cobalt, and lead (Table 5-2, Appendix F), in addition to iron, which is not shown in Table 5-2. Iron is included because iron does not have a background value and because iron concentrations exceed the risk-based screening level based on a HQ of 0.1 (Section 3.1).

5.4.2 Exposure Assessment

Default DTSC and EPA exposure parameters were used (Appendix F) with modifications for the future passive recreational user (Section 3.1.2). Additional site-specific parameters were assumed for the future construction worker exposure scenario based on the input requirement in the RSL calculator. For general construction activities (excavation and grading), "soil-other construction activities" were selected for the RSL calculator, and the following site-specific parameters were entered as inputs:

- Total area: 2.1 acres (conservative estimate)
- Area dozed: 1 acre (conservative estimate)
- Area graded: 1 acre (conservative estimate)
- Area excavated: 4,050 square meters (assumes an approximately 1-acre excavation)
- Dozing and grading blade length: 3.7 meters (based on standard equipment)
- Average depth of excavation: 3 meters

Areas are considered to be conservative because they include the total of the limits of SIWP (Figure 5-1), which are larger than visually impacted areas.

5.4.3 Toxicity Evaluation

Except for the surrogate toxicity values used for dioxins, as presented in Section 3.1.3, no COPCs requiring surrogate toxicity values were identified.

5.4.4 Human Health Risk Assessment Results

The HHRA analysis indicates that for the future passive recreational user and future construction worker scenarios, the cumulative ELCRs and HIs do not exceed 1E-06 and 1, respectively, for surface soil and mixed-zone soil (Table 5-3).

For the hypothetical future residential scenario, the cumulative ELCRs are 2E-05 for surface soil and 2E-05 for mixed-zone soil (Table 5-3), which exceed the EPA point of departure of 1E-06, but do not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). The only primary contributor to the ELCRs for both depth intervals is arsenic, which is naturally occurring. The HI is 6 for both surface soil and mixed-zone soil, which exceeds the target HI of 1. The primary contributor to the HI is arsenic. Arsenic, cobalt, and iron are naturally occurring and not related to activities at the site. The EPCs of arsenic are 1.84 mg/kg in surface soil and 1.92 mg/kg in mixed-zone soil, both less than the background value of 19 mg/kg. There are no background values available for cobalt and iron, but concentrations are not considered to be related to site activities. Excluding naturally occurring metals, the HIs for the hypothetical future residential scenario are 0.05 for surface soil and 0.2 for mixed-zone soil, both less than the target HI of 1.

No further action is required for soil at Copco No. 1 Debris Pile/Scarp yard to address human health risk concerns for soil.

The EPCs of lead are 10.89 mg/kg in surface soil and 11.84 mg/kg in mixed-zone soil, which are less than the DTSC Note 3 values (DTSC 2022a) for residential and industrial exposure scenarios (80 mg/kg and 500 mg/kg, respectively). Therefore, no further action is required for lead in soil.

5.4.5 Uncertainty Discussion

In general, the number and location of soil samples are considered adequate for risk assessment purposes, and the types of COPCs and EPCs identified are considered representative of potential releases within the Copco No. 1 Debris Pile/Scrap Yard. Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated.

5.4.6 Human Health Risk Assessment Conclusions

Estimated risks are below target thresholds for future passive recreational users, future construction workers, and hypothetical future residents from potential exposure to soil, excluding naturally occurring metals, at the Copco No. 1 Debris Pile/Scrap Yard. No further action is required.

5.5 Leaching to Groundwater Evaluation

The soil leaching COPCs at the Copco No. 1 Debris Pile/Scrap Yard are bis(2-chloroethyl) ether and naphthalene (Table 5-2, Appendix F).

Groundwater was not encountered during the site investigation sampling and depth to groundwater is unknown. The Copco No. 1 Reservoir is located approximately 1,500 feet southeast of the Copco No. 1 Debris Pile/Scrap Yard and is approximately 300 feet lower in elevation.

5.5.1 Bis(2-chloroethyl) ether

Bis(2-chloroethyl) ether was detected at a concentration exceeding the soil leaching screening level of 3.4E-05 mg/kg in only 1 of 44 samples. The sample was collected in shallow surface soil (1 to 1.5 feet bgs) at location C1DP-16 at a concentration of 0.0065 J mg/kg, where J indicates an estimated value. In all other samples, bis(2-chloroethyl) ether was not detected at concentrations that exceeded MDLs.

The concentration of bis(2-chloroethyl) ether detected at C1DP-16 is less than the soil leaching value protective of groundwater as a nondrinking water resource (0.33 mg/kg, Table 5-4).

Because bis(2-chloroethyl) ether was only detected in one soil sample at 1 to 1.5 feet bgs at C1DP-16 and was not detected in deeper samples collected at C1DP-16 (2 to 2.5 feet bgs), or at any other locations, the migration to groundwater pathway is considered incomplete.

5.5.2 Naphthalene

Naphthalene was detected at concentrations exceeding the soil leaching screening level of 0.042 mg/kg in only 2 of 44 samples. The two samples exceeding the screening level were collected in shallow surface soil (0 to 0.5 foot bgs) at locations C1DP-06 and C1DP-14. At both locations, naphthalene did not exceed the soil leaching screening levels in deeper soil samples, indicating that infiltration is not occurring. In addition, the EPC of naphthalene at the Copco No. 1 Debris Pile/Scrap Yard (0.00741 mg/kg) is less than both the soil leaching screening level and the soil leaching value protective of groundwater as a nondrinking water resource (6 mg/kg, Table 5-4). Therefore, the migration to groundwater pathway is considered incomplete.

5.5.3 Leaching to Groundwater Evaluation Conclusions

The migration to groundwater pathway is incomplete at the Copco No. 1 Debris Pile/Scrap Yard for bis(2-chloroethyl) ether and naphthalene, which are the only two COPCs with leaching potential encountered at the site.

5.6 Ecological Risk Assessment

The streamlined ERA completed for the Copco No. 1 Debris Pile/Scrap Yard was conducted on a sample-by-sample basis for each of the areas within the site. Sample-specific risk estimates are presented in Appendix G, Table G-9 and Table G-18, and the results of the streamlined ERA for each area are summarized in Table 5-5.

Several metals and dioxins exceeded their respective No Effect ESLs (Step 1) and Low Effect ESLs (Step 2). Additionally, Vanadium (Areas 1 through 4) exceeded the bird EcoPRG but did not exceed background levels. 2,3,7,8-TCDD toxic equivalent for mammals (TEQ Mammal) (Area 2) exceeded the mammal EcoPRG, but all AUF-adjusted HQs were less than 1. Sample-by-sample chemical group HIs were less than 1 for all chemical groups with and without application of AUFs.

The weight of evidence rationale for each area and each analyte is summarized as follows:

- Weight of Evidence Code "A" – Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs. In addition, the maximum detected result did not exceed the BTV. This weight of evidence code applies to the following:
  - Area 1: barium, boron, chromium, cobalt, lead, manganese, nickel, and thallium
  - Area 2: antimony chromium, cobalt, lead, manganese, nickel, and zinc
  - Area 3: barium, chromium, cobalt, manganese, molybdenum, nickel, thallium, and 2,3,7,8-TCDD TEQ Mammal
  - Area 4: barium, chromium, cobalt, manganese, mercury, nickel, thallium, and zinc
- Weight of Evidence Code "B" – Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the BTV and the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs. This weight of evidence rationale applies to arsenic in Area 2.
- Weight of Evidence Code "C" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use. This weight of evidence rationale applies to the following analytes:
  - Area 1: copper and selenium
  - Area 2: boron, copper, and selenium
  - Area 3: copper, lead, selenium, and zinc
  - Area 4: copper and selenium
- Weight of Evidence Code "D" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as either the bird or mammal EcoPRG assuming 100 percent site use. However, there are no exceedances of the EcoPRGs when the site-specific AUFs are applied. In addition, the maximum detected concentration does not exceed the BTV. This weight of evidence rationale applies to the following analytes:

- Area 1: vanadium
- Area 2: vanadium and 2,3,7,8-TCDD TEQ Mammal
- Area 3: vanadium
- Area 4: vanadium

No analytes were retained for risk management based on potential risks to ecological receptors.

5.7 Recommended Actions

The Copco No. 1 Debris Pile/Scrap Yard is recommended for closure (Section 1.2) based on the following:

- The HHRA did not recommend any COPCs for risk management.
- The leaching to groundwater evaluation concluded that migration to groundwater pathway is incomplete for the soil leaching COPCs identified at the site.
- The ERA did not recommend any COPCs for risk management.

Table 5-3. Human Risk Estimates for COPCs in Soil at Copco No. 1 Debris Pile/Scrap Yard

							Future Recreational User				Future Construction Worker				Hypothetical Future Resident

Notes:

Number presented under each step identifies the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.

-- - no samples had exceedances; analyte not retained for further evaluation.

AUF = area use factor

BTV = background threshold value

DXN = dioxin/furan

EcoPRG = ecological preliminary remedial goal

ESL = Ecological Screening Level

HQ = hazard quotient

PAH = polynuclear aromatic hydrocarbon

REC = recognized environmental condition

RSL = regional screening level

SVOC = semivolatile organic compound

Weight of Evidence Rationale Codes:

A = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL or EcoPRGs. In addition, the maximum detect did not exceed the BTV.

B = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the BTV and the No Effect ESL, none of the detected results exceeded the Low Effect RSV or EcoPRGs.

C = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use.

D = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect RSL as well as either the bird or mammal EcoPRG assuming 100 percent site use. However, there are no exceedances of the EcoPRGs when the site-specific AUFs are applied and the maximum detected result does not

6. Copco No. 2 Wood-Stave Penstock

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Copco No. 2 Wood-Stave Penstock.

6.1 Background

The Copco No. 2 Wood-Stave Penstock (penstock; site) is part of the water conveyance system that transports water from the Copco No. 2 Dam to the Copco No. 2 Powerhouse. The 1,313-foot-long, 16-foot-diameter penstock is composed of narrow beveled wood-staves banded with steel hoops (Photograph 6-1). The site is bounded by elevated access roads on each side of the penstock (Figure 6-1). Soil within the site is generally classified as Lassen-Kuck complex, stony (USDA 2021).

Photograph 6-1. Copco No. 2 Wood-Stave Penstock (Jacobs 2022a)

The penstock was identified as a REC based on Phase II ESA (AECOM 2020b) soil sampling results that indicated the presence of arsenic and lead at concentrations above background for the Cascade Range based on Oregon Department of Environmental Quality (ODEQ) guidance (ODEQ 2013) and the presence

of various SVOCs (anthracene, benzo[a]anthracene, benzo[b]fluoranthene, carbazole, chrysene. Creosote, fluoranthene, indeno[1,2,3-cd]pyrene, pentachlorophenol, phenanthrene) likely from the treated wood of the penstock (AECOM 2020b).

6.2 Field Activities

On May 3, 2022, the planned soil borings for the Copco No. 2 Wood-Stave Penstock were marked and cleared for utilities. Substantial leakage was observed along the length of the penstock, resulting in accumulated water in large areas below and adjacent to the penstock (Photograph 6-1). Consequently, several soil borings were moved 20 to 180 feet from their planned locations to new locations along the penstock and away from ponded water and saturated soil. Some of the soil borings were also moved to provide better access for the DPT rig. The proposed location of borehole C2WS-04 was north of the north access road in a drainage ditch that received water from the penstock leaks through a culvert under the road; however, this location was on a steep embankment and was inaccessible. For this reason, borehole C2WS-04 was moved to the south side of the road near the penstock. A more accessible culvert drainage ditch was located farther east where borehole C2WS-09 was moved into (Figure 6-1).

On May 11, 12, and 13, 2022, 16 soil borings were advanced via hand auger and DPT drilling to depths ranging from 0.5 foot to 6 feet bgs. Several soil borings were not advanced to the planned borehole depth because the hand auger or drill rig met refusal or because saturated soil (from the leaking penstock) was encountered (Table 6-1). Soil samples were collected at 0.5-foot or 1-foot intervals to the total borehole depth or until saturated soil with water from the penstock was encountered. At soil borings C2WS-01 and C2WS-03, soil samples were not collected because gravel and saturated soil conditions were encountered just below the ground surface. Water samples were collected from borings C2WS-04 and C2WS-06, where at least 1 foot of unsaturated surface soil was encountered and surface water from the penstock was not observed to drain into the boreholes (Table 6-1).

Table 6-1. Copco No. 2 Wood-Stave Penstock Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2WS-01	None	4	DPT	No samples collected, all gravel and saturated soil just below ground surface, two attempts made
C2WS-02	0-0.5, 0.5-1.5	1.5	HA	--
C2WS-03	None	3	HA	No samples collected, saturated soil just below ground surface
C2WS-04	0-0.5, 0.5-1.5	6	HA	Moved south across road next to the penstock; saturated soil at 2.5 feet bgs; collected water sample
C2WS-05	0-0.5, 0.5-1.5	2	HA	--
C2WS-06	0-0.5, 0.5-1.5	6	HA/DPT	Saturated soil at 1.5 feet bgs; collected water sample
C2WS-07	0-0.5	1.5	HA	Saturated soil at 0.5 foot bgs
C2WS-08	0-0.5, 0.5-1.5, 1.5-2.5	2.5	HA	--

Table 6-1. Copco No. 2 Wood-Stave Penstock Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2WS-09	0-0.5, 0.5-1.5	1.5	HA	Moved north across road next to culvert; attempted to 6.0 feet bgs but met refusal at 2.5 feet bgs
C2WS-10	0-0.5	1.5	HA	Saturated soil at 0.5 foot bgs
C2WS-11	0-0.5, 0.5-1.5	1.5	HA/DPT	Saturated soil at 1.5 feet bgs
C2WS-12	0-0.5, 0.5-1.5, 2.5-3.5, 5-6	6	DPT	--
C2WS-13	0-0.5, 0.5-1.5, 2-3	3	HA	Refusal met at 3 feet bgs
C2WS-14	0-0.5	0.5	HA	Refusal and saturated soil at 0.5 foot bgs
C2WS-15	0-0.5, 0.5-1.5, 1.5-2.5	2.5	HA	--
C2WS-16	0-0.5, 0.5-1.5	1.5	HA	Moved west approximately 100 feet because of saturated soil; met refusal at 2.0 feet bgs; at 0.5 foot to 1.5 feet bgs, PID = 22 ppmv

Notes:

-- = not applicable
bgs = below ground surface
DPT = direct-push technology
HA = hand auger
PID = photoionization detector
ppmv = parts per million by volume

6.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for pentachlorophenol at seven soil borings and for PAHs (predominantly benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene) at nine soil borings. Leaching to groundwater screening levels were exceeded for pentachlorophenol at ten soil borings, for PAHs (predominantly chrysene and naphthalene) at five soil borings, and for bis(2-chloroethyl) ether at one soil boring. Ecological screening levels were exceeded for pentachlorophenol at seven soil borings, for PAHs at six soil borings, for di-n-butyl phthalate at one soil boring, and for metals, most commonly boron, selenium, and cobalt, at 14 soil borings (Table 6-2, Figure 6-1). Water screening levels were exceeded for metals at soil boring C2WS-04 and for metals and PAHs at soil boring C2WS-06 (Table 6-3, Figure 6-1).

C2WS-16	PCP, Benzo(a)pyrene, Dibenzo(a,h)anthracene	PCP	PCP, Boron, Selenium

Notes:

N/A = not applicable; samples were not collected from the soil boring
PCP = pentachlorophenol
SLs = screening levels
<SLs = does not exceed screening levels

Table 6-3. Copco No. 2 Wood-Stave Penstock Boreholes with Compounds in Water that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Compounds Exceeding Water Screening Levels
C2WS-04	Arsenic, Barium, Beryllium, Chromium, Cobalt, Iron, Lead, Manganese, Mercury, Nickel, Thallium, Vanadium
C2WS-06	Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Cobalt, Iron, Lead, Manganese, Mercury, Thallium, Vanadium

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

6.4 Site-Specific Human Health Risk Assessment

6.4.1 Data Evaluation

The human health COPCs in soil at the Copco No. 2 Wood-Stave Penstock are PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene), metals (cobalt, iron, and mercury), and pentachlorophenol. The human health COPCs in shallow water at the Copco No. 2 Wood-Stave Penstock site are PAHs (benzo(a)anthracene, benzo(a)pyrene and benzo(b)fluoranthene), and metals (arsenic, barium, beryllium, cadmium, cobalt, copper, iron, lead, manganese, nickel, selenium, thallium, vanadium, and mercury).

6.4.2 Exposure Assessment

The Copco No. 2 Wood-Stave Penstock site is approximately 3.8 acres and was evaluated as one exposure area. Samples were collected in the potential source areas, which conservatively biases the sample results toward the contaminated areas.

Default DTSC and EPA exposure parameters were used (Appendix F) with modifications for the future recreational user (Section 3.1.1.2). Additional site-specific parameters were assumed for the future construction worker exposure scenario based on the input requirement in the RSL calculator. For general construction activities (excavation and grading), "soil-other construction activities" were selected for the RSL calculator, and the following conservative site-specific parameters were entered as inputs:

- Total area: 3.8 acres (conservative estimate)
- Area dozed: 3.8 acres (conservative estimate)
- Area graded: 3.8 acres (conservative estimate)
- Area excavated: 15,000 square meters (assumes most of site is excavated)
- Dozing and grading blade length: 3.7 meters (based on standard equipment)
- Average depth of excavation: 3 meters (likely a conservative over estimate given the abundance of shallow bedrock in the area)

Areas are considered to be conservative because they include the total of the limits of SIWP (Figure 6-1), which are larger than the visually impacted area.

For the future construction worker dermal exposure to shallow water, EPA default exposure assumptions for a construction worker scenario were used (Appendix F) with the modification that the dermal exposure

is 4 hours per event (conservative estimate). The shallow water is not considered potable water, so potential future exposure to shallow water through tapwater (drinking water) use was not evaluated.

6.4.3 Toxicity Evaluation

No COPCs required surrogate toxicity values.

6.4.4 Human Health Risk Assessment Results

The HHRA analysis indicates that for the future passive recreational user and future construction worker scenarios, the cumulative ELCRs and HIs do not exceed 1E-06 and 1, respectively, for surface soil and mixed-zone soil (Table 6-4).

For the hypothetical future residential scenario, the cumulative ELCRs are 1E-05 for surface soil and 2E-05 for mixed zone soil (Table 6-4), which exceed the EPA point of departure of 1E-06, but do not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). The primary contributors to the ELCRs for both depth intervals are benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and pentachlorophenol. The HIs do not exceed 1 for both surface soil and mixed zone soil.

For the future construction worker dermal exposure to the shallow water, the cumulative ELCR and the HI do not exceed 1E-06 and 1, respectively (Table 6-5).

6.4.5 Uncertainty Discussion

In general, the number and location of soil samples are considered adequate for risk assessment purposes, and the types of COPCs and EPCs identified are considered representative of potential releases from the penstock. Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated.

Shallow water was sampled in only two locations. However, because water samples were collected at suspected release locations, the data are likely biased high and the risks potentially overestimated.

6.4.6 Human Health Risk Assessment Conclusions

Estimated risks are less than target thresholds for future passive recreational users and future construction workers from exposure to site soil.

Cancer risks to hypothetical future residents exceed the EPA point of departure of 1E-06 in soil but do not exceed the EPA risk-management range. The primary contributors to risk from exposure to soil are benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and pentachlorophenol.

The risks to construction workers through dermal exposure to shallow water (not a potable water source) are less than target thresholds. This water will not be present when the facility is decommissioned and the penstock no longer conveys water.

6.5 Leaching to Groundwater Evaluation

The soil leaching COPCs at the Copco No. 2 Wood-Stave Penstock are benzo(b)fluoranthene, bis(2-chloroethyl) ether, chrysene, naphthalene, pentachlorophenol, and phenanthrene (Appendix F). Subsurface water encountered during sampling is identified as leakage and accumulated water from the penstock. Depth to actual groundwater is not known, but groundwater is presumed to not be present because of competent bedrock found at shallow depths that slopes from the penstock to the Klamath

River. The river is located approximately 90 feet north of the penstock and is approximately 30 feet lower in elevation than the penstock.

Because EPCs of benzo(b)fluoranthene and phenanthrene are less than the soil leaching screening levels and the soil leaching values protective of groundwater as a nondrinking water resource (Table 6-6), the migration to groundwater pathway is considered incomplete for these COPCs.

EPCs of bis(2-chloroethyl) ether, chrysene, naphthalene, and pentachlorophenol exceed the soil leaching screening levels, while only pentachlorophenol exceeds the soil leaching values protective of groundwater as a nondrinking water resource (Table 6-6). The potential for leaching to groundwater to present risk is discussed below for bis(2-chloroethyl) ether, chrysene, naphthalene, and pentachlorophenol.

6.5.1 Bis(2-chloroethyl) Ether

Bis(2-chloroethyl) ether was detected at a concentration exceeding the soil leaching screening level of 3.4E-05 mg/kg in only 1 of 29 samples (C2WS-08 at 0.001 J mg/kg at 0 to 0.5 foot bgs [where J indicates an estimated value]). In all other samples, bis(2-chloroethyl) ether was not detected.

Because bis(2-chloroethyl) ether was only detected in one soil sample at 0 to 0.5 foot bgs from one location (C2WS-08) and was not detected in deeper samples collected at C2WS-08 (0.5 foot to 1.5 feet and 1.5 to 2.5 feet bgs), or at any other locations, the migration to groundwater pathway is considered incomplete.

6.5.2 Chrysene

Chrysene was detected at concentrations exceeding the soil leaching screening level of 1.5 mg/kg in 7 of 29 samples. Soil borings C2WS-04, C2WS-05, C2WS-06, C2WS-13, C2WS-14, and C2WS-15 had chrysene present at concentrations exceeding the screening level and ranging from 2 mg/kg to 9.9 mg/kg. Concentrations of chrysene could potentially migrate to groundwater and exceed the drinking water resource criteria. However, because the EPC of chrysene is less than the soil leaching value protective of groundwater as a nondrinking water resource, no further evaluation is necessary for chrysene.

6.5.3 Naphthalene

At soil borings C2WS-04, C2WS-05, and C2WS-14, 3 of 29 samples, naphthalene was detected at a concentration slightly exceeding (less than an order of magnitude) the soil leaching screening level of 0.042 mg/kg. Naphthalene concentrations that exceeded the screening level ranged from 0.076 to 0.34 mg/kg and were all detected in shallow surface soil from 0 to 0.5 foot bgs. Naphthalene did not exceed the soil leaching screening level in the deeper samples collected from 0.5 foot to 1.5 feet bgs. The vertical extent is delineated, and because only three shallow surface soil samples exceed the soil leaching screening level but not deeper samples, infiltration is not occurring, and the migration to groundwater pathway is considered incomplete for naphthalene.

6.5.4 Pentachlorophenol

Pentachlorophenol was detected at concentrations exceeding the soil leaching screening level of 0.098 mg/kg in 16 of 29 samples at sample locations C2WS-02, C2WS-04, C2WS-05, C2WS-06, C2WS-07, C2WS-08, C2WS-13, C2WS-14, C2WS-15, and C2WS-16, with concentrations ranging from 0.11 mg/kg to 12 mg/kg. Concentrations of pentachlorophenol could potentially migrate to groundwater and exceed the drinking water resource criterion.

Pentachlorophenol was detected at concentrations exceeding the soil leaching screening level protective of groundwater as a nondrinking water resource of 1.5 mg/kg in in 6 of 29 samples at sample locations C2WS-04, C2WS-05, C2WS-06, C2WS-14, and C2WS-15, with concentrations exceeding the screening level ranging from 1.8 mg/kg to 12 mg/kg. Concentrations of pentachlorophenol could potentially migrate to groundwater and exceed the nondrinking water resource criterion.

6.5.5 Leaching to Groundwater Conclusions

Concentrations of chrysene and pentachlorophenol exceed soil leaching SLs at numerous sample locations and could migrate to groundwater and exceed drinking water resource criteria. However, as discussed in Section 6.4, shallow groundwater is not considered a viable source for potable water. The EPC of chrysene does not exceed the soil leaching screening level protective of groundwater as a nondrinking water resource; therefore, chrysene does not pose a threat to potential aquatic receptors in the Klamath River. Concentrations of pentachlorophenol exceed the screening level protective of nondrinking water resources and could potentially migrate to the Klamath River and exceed the freshwater habitat criteria.

6.6 Ecological Risk Assessment

The streamlined ERA completed for the penstock was conducted on a sample-by-sample basis, and sample-specific risk estimates are presented in Appendix G, Table G-10 and Table G-18. Results are summarized in Table 6-7.

Several metals, PAHs, and SVOCs exceeded their respective No Effect ESLs (Step 1) and Low Effect ESLs (Step 2). Vanadium exceeded the bird EcoPRG. The AUFs for the hermit thrush and vagrant shrew were 1 as their home ranges are smaller than the site-size for the penstock; as such, the AUF-adjusted HQs are the same as those prior to AUF-adjustment. Vanadium was the only analyte that exceeded the bird EcoPRG. However, the maximum detected concentration of vanadium does not exceed regional background levels. Sample-by-sample chemical group HIs were less than 1 for all chemical groups with and without application of AUFs.

The weight of evidence rationale for each area and analyte is summarized as follows:

- Weight of Evidence Code “A” – Chemical is not retained for risk management for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. In addition, there were no exceedances of the BTV for metals. This weight of evidence rationale applies to the following analytes:
  - Metals: antimony, arsenic, barium, boron, chromium, cobalt, manganese, thallium, and zinc
  - PAHs: acenaphthene, benzo(a)anthracene, chrysene, phenanthrene, and pyrene
  - SVOCs: bis (2-ethylhexyl) phthalate, and di-N-butylphthalate
- Weight of Evidence Code “B” – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use). This weight of evidence rationale applies to the following analytes:
  - Metals: copper, lead, mercury, and selenium
  - PAHs: fluoranthene
  - SVOCs: pentachlorophenol
- Weight of Evidence Code “C” – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird EcoPRG assuming 100 percent site use; however, the maximum detected result does not exceed the BTV. This weight of evidence rationale applies to vanadium.

- Weight of Evidence Code "D" – Chemical group is not retained for risk management for ecological receptors. All sample-by-sample chemical group HIs were less than 1 with and without application of AUFs. This weight of evidence rationale applies to the following:
  - PAHs: low molecular weight PAHs, high molecular weight PAHs

No analytes in site soil were retained for risk management based on potential risks to ecological receptors.

6.7 Recommended Actions

The ERA indicates that site COPCs detected at concentrations greater than ecological screening levels do not need to be retained for risk management. The HHRA did not recommend any COPCs for risk management for future passive recreational users and future construction workers from exposure to soil and water.

The HHRA indicates that cancer risks to hypothetical future residents are exceeded because of the presence of benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and pentachlorophenol in site soil. Furthermore, concentrations of pentachlorophenol in site soil exceed soil leaching screening levels protective of nondrinking water resources, and therefore could potentially migrate to the Klamath River.

A remedial action plan will be developed to address human health risks from PAHs and pentachlorophenol in soil and to address leaching to groundwater concerns for pentachlorophenol in site soil. Additional investigation at this site following removal of the penstock may be warranted to refine the preliminary excavation area (Figure 6-2). The remediation plan will not address removal of accumulated water from beneath the penstock because:

- The accumulated water will not be present after the penstock is dewatered and removed.
- The HHRA did not recommend any COPCs for risk management of the shallow water below the penstock for construction workers.
- The accumulated water beneath the penstock, is not considered potable water source.

Notes:
Number presented under each step identifes the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.
-- - no samples had exceedances; analyte not retained for further evaluation
AUF = area use factor
BTV = background threshold value
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient
PAH = polynuclear aromatic hydrocarbon
REC = recognized environmental condition
RSL = regional screening level
SVOC = semivolatile organic compound

Weight of Evidence Rationale Codes:

A = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL or EcoPRGs for birds or mammals. In addition, there were no exceedances of the BTV (metals).

B = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use).

C = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect RSL as well as the Bird EcoPRG assuming 100 percent site use. However, the maximum detected result does not exceed the BTV.

7. Copco No. 2 Wood Pile

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Copco No. 2 Wood Pile.

7.1 Background

The *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020a) identified three utility pole stockpiles approximately three-quarters of a mile northeast of the intersection of Copco Road and Daggett Road. The utility poles were stockpiled at this location after they had been removed from service. AECOM noted that some of the utility poles were potentially chemically treated (Photograph 7-1). No other features of concern were observed in this area. In June 2021, PacifiCorp collected spatial data locating the corners of the three wood piles and then removed the utility poles for appropriate disposal offsite. The wood piles are numbered 1 through 3 (Figures 7-1 and 7-2).

Photograph 7-1. Copco No. 2 Wood Pile #3 Looking South (PacifiCorp 2021)

7.2 Field Activities

On March 2, 2022, the planned soil borings for the Copco No. 2 Wood Pile were marked and cleared for utilities. A GPS unit was used to relocate the corners of the three utility pole stockpiles using data previously collected by PacifiCorp (Figure 7-1).

On March 8, 2022, seven soil borings were advanced via hand auger and DPT drilling to depths of 5 or 6 feet bgs. Soil samples were collected from 6-inch intervals at varying depths to the bottom of the boreholes (Table 7-1). Site soils were predominantly dark brown moist clays to total borehole depth (5 or 6 feet bgs), except at soil boring C2WP-06 where dark brown, poorly graded gravel was identified to a depth of 6 feet bgs. Groundwater was not observed in any of the borings. All soil borings were advanced and sampled per the California SIWP.

Table 7-1. Copco No. 2 Wood Pile Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2WP-01	0-0.5, 2-2.5, 4.5-5	5	HA/DPT	--
C2WP-02	0-0.5, 1-1.5, 3-3.5, 5.5-6	6	HA/DPT	--
C2WP-03	0-0.5, 2-2.5, 4.5-5	5	HA/DPT	--

C2WP-05	0-0.5, 2-2.5, 4.5-5	5	HA/DPT	--
C2WP-06	0-0.5, 1-1.5, 3-3.5, 5.5-6	6	HA/DPT	--
C2WP-07	0-0.5 2-2.5, 4.5-5	5	HA/DPT	--

Notes:
-- = no comment
bgs = below ground surface
HA = hand auger
DPT = direct-push technology

7.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for cobalt, pentachlorophenol, and iron. Leaching to groundwater screening levels were exceeded for bis(2-chloroethyl) ether and pentachlorophenol. Ecological screening levels were exceeded for various metals, pentachlorophenol, benzoic acid, and bis(2-ethylhexyl) phthalate (Table 7-2, Figure 7-1).

Table 7-2. Copco No. 2 Wood Pile Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Area	Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
Wood Pile #1	C2WP-01	Cobalt	<SLs	Cobalt, Selenium
	C2WP -02	Cobalt	Bis(2-chloroethyl) ether	Boron, Cobalt, Selenium
Wood Pile #2	C2WP-03	Cobalt	Pentachlorophenol	Pentachlorophenol Boron, Cobalt, Selenium
	C2WP-04	Pentachlorophenol Cobalt, Iron	Pentachlorophenol	Pentachlorophenol Boron, Cobalt, Selenium
Wood Pile #3	C2WP-05	Cobalt, Iron	Pentachlorophenol	Boron, Cobalt, Selenium

Table 7-2. Copco No. 2 Wood Pile Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Area	Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
	C2WP-06	Cobalt, Iron	Pentachlorophenol	Pentachlorophenol Boron, Cobalt, Selenium
	C2WP-07	Cobalt, Iron	<SLs	Boron, Cobalt, Selenium, Benzoic Acid, Bis(2-ethylhexyl) phthalate

Notes:

SLs = screening levels

<SLs = does not exceed screening levels

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

7.4 Site-Specific Human Health Risk Assessment

7.4.1 Data Evaluation

The human health COPCs in soil at the Copco No. 2 Wood Pile are cobalt, iron, and pentachlorophenol (Appendix F).

7.4.2 Exposure Assessment

Because of the small size of the Copco No. 2 Wood Pile (approximately 100 feet by 150 feet), the site is considered one exposure area. Samples were collected in the three wood pile source areas identified, which conservatively biases the sample results toward the source areas.

Additional site-specific parameters were assumed for the future construction worker exposure scenario based on the input requirement in the RSL calculator. For general construction activities (excavation and grading), "soil-other construction activities" were selected for the RSL calculator, and the following site-specific parameters were entered as inputs:

- Total area: 1 acre (conservative estimate)
- Area dozed: 1 acre (conservative estimate)
- Area graded: 1 acre (conservative estimate)
- Area excavated: 10,000 square feet (assumes approximately 100 feet by 100 feet excavation)
- Dozing and grading blade length: 3.7 meters (m) (based on standard equipment)
- Average depth of excavation: 3 m

7.4.3 Toxicity Assessment

No COPCs identified at this site required surrogate toxicity values.

7.4.4 Human Health Risk Evaluation Results

Soil risk calculations for the Copco No. 2 Wood Pile are provided (Table 7-3) for surface soil (0 foot to 2 feet bgs) and mixed-zone soil (0 foot to 10 feet bgs). Analysis indicates that for the future passive recreational user and future construction worker scenarios, the cumulative ELCRs and HIs do not exceed 1E-06 and 1, respectively, for surface soil and mixed-zone soil (Table 7-3).

For the hypothetical future residential scenario, the cumulative ELCRs are 5E-05 for surface soil and 2E-05 for mixed-zone soil (Table 7-3), which exceed the EPA point of departure of 1E-06, but do not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). The only primary contributor to the ELCRs for both surface soils and the mixed-zone soil is pentachlorophenol. The HIs are 3 for surface soil and 2 for mixed-zone soil, which exceed the target HI of 1. The primary contributors are cobalt and iron, both of which are considered naturally occurring. Because cobalt and iron are not used in treated wood preservatives, the only source of potential contamination at this site, they are not considered to be site-related contaminants. No background values are available for cobalt or iron, but the uniformity of sample results (cobalt concentrations ranged from 22 mg/kg to 36 mg/kg and iron concentrations ranged from 40,000 mg/kg to 59,000 mg/kg), along with the fact that all other metals are less than background values, indicate that cobalt and iron found at this location are naturally occurring and not related to activities at the site. Excluding naturally occurring cobalt and iron, the HIs are 0.05 for surface soil and 0.02 for mixed-zone soil, both less than the target HI of 1.

7.4.5 Uncertainty Discussion

In general, the number and location of soil samples are considered adequate for risk assessment purposes, and the type of COPCs and EPCs identified are considered representative of potential releases within the Copco No. 2 Wood Pile site. Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated. The highest concentrations of pentachlorophenol were detected at sample location C2WP-04 where screening levels were exceeded at all depths (0.5, 1.5, 3.5, and 6 feet bgs). Because pentachlorophenol contamination at C2WP-04 has not been delineated laterally or vertically, there is a risk assessment data gap which causes uncertainty in the risk results for pentachlorophenol.

7.4.6 Human Health Risk Assessment Conclusions

Estimated risks are below target thresholds for future passive recreational users and future construction workers from potential exposure to soil. Cancer risks to hypothetical future residents exceed the EPA point of departure of 1E-06 but do not exceed the EPA risk management range. The primary contributor to risk is pentachlorophenol. Because pentachlorophenol contamination at C2WP-04 has not been delineated laterally or vertically, there is a risk assessment data gap which causes uncertainty in the risk results for pentachlorophenol.

7.5 Leaching to Groundwater Evaluation

Bis(2-chloroethyl) ether and pentachlorophenol exceed the soil leaching SLs and are COPCs at the Copco No. 2 Wood Pile (Table 7-4). Groundwater was not encountered during the SI sampling and depth to groundwater is not known. Fall Creek is located approximately 200 feet east of the Copco No. 2 Wood Pile and is approximately 35 to 40 feet lower in elevation. Therefore, depth to groundwater is estimated to be at least 35 feet bgs.

7.5.1 Bis(2-chloroethyl) ether

Bis(2-chloroethyl) ether was detected at a concentration exceeding the soil leaching screening level of 3.4E-05 mg/kg in only one field duplicate sample (C2WP-02-0.5-FD at 0.0016 J mg/kg at 0.5 foot bgs) of 24 samples. In all other samples, including the native sample paired with the field duplicate (C2WP-02-0.5), bis(2-chloroethyl) ether was not detected at concentrations greater than the MDLs. The concentration of bis(2-chloroethyl) ether detected at C2WP-02 is less than the soil leaching value protective of groundwater as a nondrinking water resource (0.33 mg/kg, Table 7-4).

Because bis(2-chloroethyl) ether was only detected at 0.5 foot bgs at C2WP-02 and was not detected in deeper samples collected at C2WP-02 (1.5, 3.5, and 6 feet bgs), or at any other locations, the migration to groundwater pathway is considered incomplete.

7.5.2 Pentachlorophenol

Pentachlorophenol was detected at concentrations exceeding the soil leaching screening level of 0.098 mg/kg in 8 of 24 samples at the following four sample locations:

- C2WP-03: Pentachlorophenol exceeds the soil leaching screening level at 2.5 feet bgs (0.37 mg/kg) and 5 feet bgs (0.2 mg/kg), but does not exceed the soil leaching screening level at 0.5 foot bgs (0.017 mg/kg). Because samples were not collected deeper than 5 feet bgs, vertical extent is not delineated.
- C2WP-04: Pentachlorophenol exceeds the soil leaching screening level at 0.5 foot bgs (27 mg/kg), 1.5 feet bgs (32 mg/kg), 3.5 feet bgs (5.2 mg/kg), and 6 feet bgs (7.2 mg/kg). The vertical and lateral extent is not delineated at this location.
- C2WP-05: Pentachlorophenol exceeds the soil leaching screening level at 0.5 foot bgs (0.34 mg/kg) but is less than the soil leaching screening level at 2.5 feet bgs (0.077 mg/kg) and 5 feet bgs (0.03 mg/kg). The vertical extent is delineated, and because only the shallowest surface soil concentration slightly exceeds (less than an order of magnitude) the soil leaching screening level but does not exceed concentrations found in deeper samples, the migration to groundwater pathway is considered incomplete at C2WP-05.
- C2WP-06: Pentachlorophenol exceeds the soil leaching screening level at 0.5 foot bgs (0.53 mg/kg) but is less than the soil leaching screening level at 1.5 feet bgs (0.028 mg/kg) and was not detected at 3.5 or 6 feet bgs. The vertical extent is delineated, and because only the shallowest surface soil concentration slightly exceeds (less than an order of magnitude) the soil leaching screening level but it was not detected in deeper samples, the migration to groundwater pathway is considered incomplete at C2WP-06.

Concentrations of pentachlorophenol exceed the soil leaching screening level in all samples collected at C2WP-04, and because pentachlorophenol is not vertically delineated, there remains a potential migration pathway to groundwater.

The concentrations of pentachlorophenol detected at C2WP-04 also exceed the soil leaching value protective of groundwater as a nondrinking water resource (1.5 mg/kg, Table 7-4); however, concentrations detected at all other sample locations are less than this value.

7.5.3 Leaching to Groundwater Conclusions

The concentrations of pentachlorophenol at sample locations C2WP-01, C2WP-02, C2WP-05, and C2WP-06 indicate that the migration to groundwater pathway is incomplete at those locations. Concentrations of pentachlorophenol at sample locations C2WP-03 and C2WP-04 exceed soil leaching screening levels and, because the vertical extent of the contamination could not be defined, there remains a potential migration pathway to groundwater.

7.6 Ecological Risk Assessment

The streamlined ERA completed for the Copco No. 2 Wood Pile was conducted on a sample-by-sample basis. Sample-specific risk estimates are presented in Appendix G, Table G-11 and Table G-18, and results are summarized in Table 7-5.

Several metals and pentachlorophenol exceeded their respective No Effect ESLs (Step 1) and Low Effect ESLs (Step 2). Vanadium exceeded the bird EcoPRG and pentachlorophenol exceeded the mammal EcoPRG assuming 100 percent site use; however, all HQs were less than 1 when the AUF was applied. The maximum detected concentration of vanadium did not exceed the regional background level. Sample-by-sample chemical group HIs were less than 1 for all chemical groups with and without application of AUFs.

The weight of evidence rationale for each analyte is summarized as follows:

- Weight of Evidence Code "A" – Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL and the maximum detected result did not exceed the BTV. This weight of evidence rationale applies to the following analytes:
  - Metals: arsenic, barium, boron, cobalt, manganese, mercury, nickel, thallium, and zinc
  - SVOCs: benzoic acid and bis (2-ethylhexyl) phthalate
- Weight of Evidence Code "B" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use. In addition, the maximum detected result did not exceed the BTV. This weight of evidence rationale applies to chromium, copper, and lead.
- Weight of Evidence Code "C" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use. This weight of evidence rationale applies to selenium.
- Weight of Evidence Code "D" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird EcoPRG assuming 100 percent site use; however, the maximum detected result does not exceed the BTV. This weight of evidence rationale applies to vanadium.
- Weight of Evidence Code "E" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the mammalian EcoPRG assuming 100 percent site use; however, no results exceed the Bird EcoPRG (100 percent site use) and none of the AUF-adjusted HQs exceeded 1 for either birds or mammals. This weight of evidence rational applies to pentachlorophenol.

No analytes in site soil were retained for risk management based on potential risks to ecological receptors.

7.7 Recommended Actions

The ERA indicates that no analytes in site soil were retained for risk management based on potential risks to ecological receptors. The HHRA did not recommend any COPCs for risk management for future passive recreational users and future construction workers for Wood Pile No. 1 and Wood Pile No. 3; therefore, no further assessment is necessary at these specific locations. At Wood Pile No. 2, a data gap is causing uncertainty in the HHRA because pentachlorophenol was not vertically or laterally delineated. Soil borings at this specific wood pile exceeded the screening level for leaching to groundwater for pentachlorophenol.

To expedite site closure, PacifiCorp is recommending excavation and disposal of soil from beneath Wood Pile No. 2. The lengthier process of iterative sampling to first confirm the vertical and lateral extent of pentachlorophenol at Wood Pile No. 2 will not be performed. Instead, the 25-foot by 60-foot footprint of Wood Pile No. 2 will be excavated to a depth of at least 6 feet bgs (Figure 7-2).

Notes:
Number presented under each step identifes the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.
-- - no samples had exceedances; analyte not retained for further evaluation.
AUF = area use factor
BTV = background threshold value
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient
REC = recognized environmental condition
RSL = regional screening level
SVOC = semivolatile organic compound

Weight of Evidence Rationale Codes:

A = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL and the maximum detected result did not exceed the BTV.

B = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use. In addition the maximum detected result did not exceed the BTV.

C = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use.

D = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect RSL as well as the Bird EcoPRG assuming 100 percent site use; however, the maximum detected result does not exceed the BTV.

E = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect RSL as well as the Mammalian EcoPRG assuming 100 percent sites use; however, no results exceed the Bird EcoPRG (100 percent site use) and none of the AUF-adjusted HQs exceeded for either birds or mammals.

8. Copco No. 2 Powerhouse Transformer Fire

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Copco No. 2 Powerhouse Transformer Fire.

8.1 Background

In May 2006, an aboveground Transformer C located in front of the south side of the Copco No. 2 Powerhouse caught fire, resulting in a release of transformer oil. Transformer C initially contained 3,680 gallons of oil; 2,965 gallons of oil were pumped out of the transformer after the incident. The total volume of oil lost (spilled or combusted) during the fire is estimated to be 715 gallons (Parametrix 2006).

In July 2006, Parametrix advanced six DPT borings (Copco-01 to Copco-06) and two hand auger borings (Copco-07 and Copco-08) for collection of soil samples at depths ranging from 1 to 25 feet bgs. Soil within the Copco No. 2 Powerhouse Transformer Fire site is generally classified as Medford clay loam, cool (USDA 2021). The soil samples were analyzed for diesel range and heavy oil range TPHs. At boring Copco-06, located near the footprint of Transformer C, the soil samples were also analyzed for PCBs. The highest TPH concentrations were detected in the top 3 feet of soil and above a layer of concrete beneath the transformers. Detected DRO concentrations ranged from 7.4 to 650 mg/kg, and oil range organics concentrations ranged from 6.8 to 250 mg/kg. The residential and leaching to groundwater screening level for DRO was exceeded in one soil sample and at a depth of 1 foot bgs at boring Copco-07. At boring Copco-06, PCBs were not detected (above the MDL of 0.0670 mg/kg) in any of the soil samples. PCBs were not analyzed at any other boring location.

The soil sampling results were submitted to the Siskiyou County Department of Public Health by PacifiCorp (PacifiCorp 2006). The Siskiyou County Department of Public Health stated in a follow-up letter to PacifiCorp on September 21, 2006, that no further site investigation was required, and that the Department concurred with PacifiCorp's plan to assess soil beneath the transformers when they were dismantled and to characterize the site soils for proper disposal (PacifiCorp 2006).

Because there are no records confirming removal of TPH-impacted soil when the transformers were dismantled, PacifiCorp decided to collect soil samples as outlined in the California SIWP.

8.2 Field Activities

On March 2, 2022, the planned soil borings for the Copco No. 2 Powerhouse Transformer Fire site were marked and cleared for utilities (Section 2). Borehole locations were moved to avoid the numerous underground utilities in the area (Figure 8-1, Photograph 8-1).

On March 9 and 10, 2022, five soil borings were advanced by hand auger and DPT drilling to depths of 1.5 or 2 feet bgs (Table 8-1). At soil boring C2TF-01, soil samples were collected from a depths of 0 to 1 foot bgs and from 1 to 2 feet bgs. Hand auger refusal was encountered at a depth of 2 feet bgs due to the presence of cobbles and bedrock.

At soil borings C2TF-02, C2TF-03, C2TF-04, and C2TF-05, a DPT rig was used to core the surficial layer of asphalt, and then a hand auger was used to avoid damaging any subsurface utilities. Below the asphalt, several inches of new road base was observed on top of a layer of new pea gravel. Concrete was encountered at a depth of 1.5 to 2.0 feet bgs at C2TF-02 through C2TF-04. The pea gravel layer consistently caused borehole collapse from 1.5 and 2 feet bgs. Consequently, soil samples were not collected from borings C2TF-02, C2TF-04, and C2TF-05, and a sample of the pea gravel was instead

collected to demonstrate that clean backfill had been used upon removal of the transformers. Groundwater was not observed in any of the soil borings.

Photograph 8-1. Location of Four Boreholes (white paint) and Underground Anomalies (pink paint) at the Former Transformers (Jacobs 2022a)

Table 8-1. Copco No. 2 Powerhouse Transformer Fire Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2TF-01	0-1, 1-2	2	HA	Located in soil/gravel area east of Powerhouse and former transformers; hand auger refusal at 2 feet bgs
C2TF-02	None	2	DPT/HA	Cored 6-inch asphalt, road base, pea gravel, refusal (concrete) at 2 feet bgs; no samples collected
C2TF-03	1-1.5	1.5	DPT/HA	Cored 6-inch asphalt, road base, pea gravel, refusal (concrete) at 2 feet bgs. Sample collected to demonstrate use of clean fill.
C2TF-04	None	2	DPT/HA	Cored 6-inch asphalt, road base, pea gravel, refusal (concrete) at 2 feet bgs; no samples collected
C2TF-05	None	2	DPT/HA	Cored 6-inch asphalt, road base, pea gravel, refusal (hole collapsed) at 2 feet bgs; no samples collected

Table 8-1. Copco No. 2 Powerhouse Transformer Fire Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
Notes: bgs = below ground surface DPT = direct-push technology HA = hand auger				

8.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for DRO, Aroclor 1262 (PCB), and PAHs [benzo(a)pyrene and dibenzo(a,h)anthracene] at soil boring C2TF-01. The leaching to groundwater screening level was also exceeded for DRO at soil boring C2TF-01. Ecological screening levels were not exceeded at any of the soil borings (Table 8-2, Figure 8-1).

Table 8-2. Copco No. 2 Powerhouse Transformer Fire Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
C2TF-01	Diesel Range Organics, Aroclor 1262, Benzo(a)pyrene, Dibenzo(a,h)anthracene	Diesel Range Organics	<SLs
C2TF-02	Not sampled	Not sampled	Not sampled
C2TF-03	<SLs	<SLs	<SLs
C2TF-04	Not sampled	Not sampled	Not sampled
C2TF-05	Not sampled	Not sampled	Not sampled

Notes:
SLs = screening levels
<SLs = does not exceed screening levels

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

8.4 Site-Specific Human Health Risk Assessment

8.4.1 Data Evaluation

The human health COPCs in soil at the Copco No. 2 Powerhouse Transformer Fire site are DRO, Aroclor 1262, benzo(a)pyrene, and dibenzo(a,h)anthracene (Appendix F).

8.4.2 Exposure Assessment

Because only three surface soil samples were collected, mixed-zone soil was not evaluated, and maximum detected concentrations were used as the EPCs.

Default DTSC and the EPA exposure parameters were used (Appendix F) with modifications for the future recreational user (Section 3.1.2). Additional site-specific parameters were assumed for the future construction worker exposure scenario based on the input requirement in the RSL calculator. For general construction activities (excavation and grading), "soil-other construction activities" were selected for the RSL calculator, and the following conservative site-specific parameters were entered as inputs:

- Total area: 0.5 acre (minimum input for RSL calculator)
- Area dozed: 0.01 acre (conservative estimate of site size)
- Area graded: 0.01 acre (conservative estimate of site size)
- Area excavated: 50 square meters (assumes entire site is excavated)
- Dozing and grading blade length: 3.7 meters (based on standard equipment)
- Average depth of excavation: 3 meters

8.4.3 Toxicity Assessment

Surrogate toxicity values (Section 3) were used to evaluate Aroclor 1262.

8.4.4 Human Health Risk Assessment Results

The HHRA analysis indicates that for the future active recreational user, the cumulative ELCR and HI do not exceed 1E-06 and 1, respectively, for surface soil (Table 8-3). For the future construction worker scenario, the cumulative ELCR does not exceed 1E-06, but the HI is 5, which exceeds the target HI of 1. The primary contributor to the HI is DRO.

For the hypothetical future residential scenario, the cumulative ELCR is 9E-06, which exceeds the EPA point of departure of 1E-06 but does not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). The primary contributors to the ELCR are Aroclor 1262, benzo(a)pyrene, and dibenzo(a,h)anthracene. The HI is 5, which exceeds the target HI of 1. The primary contributor to the HI is DRO.

8.4.5 Uncertainty Discussion

In general, the number and location of soil samples are considered adequate for risk assessment purposes, and the types of COPCs and EPCs identified are considered representative of potential releases within the Copco No. 2 Powerhouse Transformer Fire site. Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated.

The highest concentrations of Aroclor 1262 were detected at sample location C2TF-01 where residential RBCs were exceeded at all depths (0 to 1 foot and 1 to 2 feet bgs). The highest concentration of DRO was detected at sample location C2TF-01 where the residential RBC was exceeded (1 to 2 feet bgs). Because Aroclor 1260 and DRO at C2TF-01 have not been delineated laterally or vertically, the resulting risk assessment data gap causes uncertainty in the risk results.

8.4.6 Human Health Risk Assessment Conclusions

Estimated risks are below target thresholds for future active recreational users from potential exposure to COPCs in soil.

Noncancer HIs exceed the target HI of 1 for future construction workers and hypothetical future residents. The primary contributor to the HI is DRO. The concentration of DRO exceeds the residential RBC of 960 mg/kg at location C2TF-01 (1 to 2 feet bgs). The vertical extent of the DRO contamination has not been delineated.

Cancer risks to hypothetical future residents exceed the EPA point of departure of 1E-06. The primary contributors to risk are Aroclor 1262, benzo(a)pyrene, and dibenzo(a,h)anthracene. Concentrations of Aroclor 1262 exceed the residential RBC of 0.24 mg/kg at location C2TF-01 (0 to 1 foot and 1 to 2 feet bgs). The vertical extent of Aroclor 1262 has not been delineated. Benzo(a)pyrene and dibenzo(a,h)anthracene exceed the residential RBCs of 0.11 mg/kg and 0.028 mg/kg, respectively, at location C2TF-01 (0 to 1 foot bgs).

8.5 Leaching to Groundwater Evaluation

The soil leaching COPC at the Copco No. 2 Powerhouse Transformer Fire site is DRO (Appendix F). Groundwater was not encountered during the site investigation sampling and depth to groundwater is not known. The Klamath River is located approximately 60 feet northwest of the Copco No. 2 Powerhouse Transformer Fire site and is approximately 20 feet lower in elevation. Therefore, depth to groundwater is estimated to be approximately 15 or more feet bgs.

Diesel range organics were detected at a concentration exceeding the soil leaching screening level of 1,100 mg/kg in one sample (C2TF-01 at 4,400 mg/kg at 1 to 2 feet bgs) out of three samples. The concentration of DRO detected at C2TF-01 is less than the soil leaching value protective of groundwater as a nondrinking water resource of 7,300 mg/kg (Table 8-4). Because refusal was met, samples were not collected deeper than 2 feet bgs and the vertical extent is not delineated.

The concentration of DRO at sample location C2TF-01 exceeds the soil leaching screening level and, because the vertical extent of the DRO contamination has not been delineated, poses a potential threat to groundwater.

8.6 Ecological Risk Assessment

The streamlined ERA for the Transformer Fire area was conducted on a sample-by-sample basis and all risk estimates are presented in Appendix G, Table G-12 and Table G-18. The Copco No. 2 Powerhouse Transformer Fire site is not retained for further ecological risk assessment because there were no exceedances of the No Effect ESLs (Step 1) or chemical group exceedances (Table G-18). Therefore, no analytes in site soil were retained for risk management based on potential risks to ecological receptors.

8.7 Recommended Actions

The ERA did not recommend any COPCs for risk management. However, the HHRA and leaching to groundwater risk assessments identified DRO above target risk levels. PAHs and Aroclor 1262 were also present above target HHRA risk levels.

Soil impacted with DRO, Aroclor 1262, benzo(a)pyrene, and dibenzo(a,h)anthracene in the immediate vicinity of soil boring C2TF-01 will be excavated after the Copco No. 2 Powerhouse utilities have been deenergized (Figure 8-2). A 20-foot by 10-foot footprint will be excavated to a depth of at least 2 feet bgs. The excavation will proceed to bedrock or until confirmation samples from excavation floor and sidewall samples indicate EPCs of DRO, Aroclor 1262, benzo(a)pyrene, and dibenzo(a,h)anthracene are less than the residential RBCs (960 mg/kg, 0.24 mg/kg, 0.11 mg/kg, and 0.028 mg/kg, respectively).

Table 8-3. Human Health Risk Estimates for COPCs in Soil at Copco 2 Powerhouse Transformer Fire

							Future Recreational User				Future Construction Worker				Hypothetical Future Resident			
Type	COPC	CAS	MDC (mg/kg)	EPC (mg/kg)	EPC Basis	Background Related? 9. Copco No. 2 Former Mobile Oil Containment Building and Underground Storage Tanks

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Copco No. 2 Former Mobile Oil Containment Building and Underground Storage Tanks sites. The two sites were evaluated as a single site under the risk assessments because of their proximity, interrelatedness, and similar COPCs.

9.1 Copco No. 2 Former Mobile Oil Containment Building

9.1.1 Background

The existing Maintenance Building (Photograph 9-1) is west of the Copco No. 2 Powerhouse and within the footprint of the former Mobile Oil Containment Building. A shop was historically located southwest of the Mobile Oil Containment Building (Figure 9-1). There was no observable evidence of either of these structures during the Phase I ESA, and there were no records documenting an environmental release, facility demolition, or soil removal activities resulting from potential spills or leaks of petroleum hydrocarbons at these former buildings (AECOM 2018). The former buildings were consequently included in Exhibit C because of the potential for undocumented petroleum hydrocarbon releases to the environment.

Photograph 9-1. Existing Maintenance Building (Jacobs 2021a)

9.1.2 Field Activities

On March 1, 2022, the seven planned soil borings (C2CB-01 through C2CB-07) for Copco No. 2 Former Mobile Oil Containment Building were marked and cleared for utilities (Section 2). Soil borings C2CB-01 through C2CB-04 were advanced on each side of the Maintenance Building, and three soil borings were

advanced within the footprint of the former shop (Figure 9-1). Boring C2CB-07 was moved approximately 20 feet northwest and adjacent to a geophysical anomaly. To determine if USTs were present, geophysical surveys were performed over a 1.2-acre area by Spectrum Geophysics, who found no geophysical anomalies indicative of USTs.

On March 7, 2022, soil borings C2CB-01 through C2CB-07 were advanced for logging purposes and for collection of soil samples if soil was determined to have been impacted by TPHs. A hand auger was used until refusal was met, after which a DPT rig was used to advance the boring and collect continuous soil cores to a depth of 10 feet bgs. Recovered soil cores from each boring were logged and screened with a PID. The recovered soil from each boring was determined to not have been impacted by TPHs (no staining, odor, or PID readings greater than 50 parts per million by volume [ppmv]). Consequently, soil samples were not collected (Table 9-1). However, the analytical results for waste profiling of the combined and containerized soil cuttings indicated the presence of DROs above the screening levels. The analytical results for waste profiling of containerized water from equipment decontamination also indicated the presence of DRO and VOCs above screening levels. Because site-specific contamination could not be ruled out, PacifiCorp decided to return to the site, install additional borings at the same general location, and collect soil samples from these locations. Groundwater samples were to be collected, if encountered.

On May 3, 2022, soil borings C2CB-08 through C2CB-14 were marked adjacent to the original soil borings (Figure 9-1) and then the planned soil borings were cleared for utilities. On May 10 and 11, 2022, a DPT rig was used to advance the soil borings to a depth of 10 to 25 feet bgs. Continuous soil cores were collected, and composite soil samples were collected at 5-foot intervals from surface grade to the depth of the boring (Table 9-1). Temporary wells (Section 2) were installed in soil borings C2CB-08, C2CB-10, and C2CB-11; groundwater was not encountered in the other soil borings. A disposable bailer was used to collect grab groundwater samples from soil borings C2CB-08 and C2CB-10. A grab groundwater sample was not collected from soil boring C2CB-11 because the temporary well remained dry (Table 9-1).

Table 9-1. Copco No. 2 Former Mobile Oil Containment Building Borehole Summary

Borehole ID	Sample Interval (feet bgs)	Depth (feet)	Method	Comments
C2CB-01	None	10	HA/DPT	Not impacted by TPH;[a] no samples collected
C2CB-02	None	10	HA/DPT	Not impacted by TPH; no samples collected
C2CB-03	None	10	HA/DPT	Not impacted by TPH; no samples collected
C2CB-04	None	10	HA/DPT	Not impacted by TPH; no samples collected
C2CB-05	None	10	HA/DPT	Not impacted by TPH; no samples collected
C2CB-06	None	10	HA/DPT	Not impacted by TPH; no samples collected
C2CB-07	None	10	HA/DPT	Not impacted by TPH; no samples collected
C2CB-08	0-5, 5-10, 10-15	25	HA/DPT	Advanced adjacent to boring C2CB-01; collected groundwater sample
C2CB-09	0-5, 5-10	10	HA/DPT	Advanced adjacent to boring C2CB-02; not impacted by TPH
C2CB-10	0-5, 5-10, 10-15, 15-20, 20-25	25	HA/DPT	Advanced adjacent to boring C2CB-03; not impacted by TPH; after stabilization, DTW 23.3 feet bgs; collected groundwater sample

Table 9-1. Copco No. 2 Former Mobile Oil Containment Building Borehole Summary

Borehole ID	Sample Interval (feet bgs)	Depth (feet)	Method	Comments
C2CB-11	0-5, 5-10, 10-15, 15-20, 20-23	23	HA/DPT	Advanced adjacent to boring C2CB-04; not impacted by TPH; installed temporary well that remained dry
C2CB-12	0-5, 5-10	10	HA/DPT	Advanced adjacent to boring C2CB-05; not impacted by TPH
C2CB-13	0.5-5, 5-10, 10-15, 15-20, 20-23	23	HA/DPT	Advanced adjacent to boring C2C6B-06; not impacted by TPH
C2CB-14	0-5, 5-10	10	HA/DPT	Advanced adjacent to boring C2CB-07; not impacted by TPH

[a] The phrase "not impacted by TPH" in this table row and others means soil was not stained, odorous, or characterized by PID readings greater than 50 ppmv.

bgs = below ground surface

DPT = direct-push technology

DTW = depth to water

HA = hand auger

PID = photoionization detector

ppmv = parts per million by volume

TPH = total petroleum hydrocarbon

9.1.3 Analytical Results

The analytical results from soil borings C2CB-08 to C2CB-14 were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Soil from borings C2CB-08 through C2CB-14 and groundwater from temporary well C2CB-10 were not found to contain COPCs at concentrations that exceeded screening levels (Table 9-2). Groundwater from temporary well C2CB-08 contained DRO at a concentration of 290 µg/l, which exceeds the screening level of 200 µg/l (Table 9-2, Figure 9-1).

Table 9-2. Copco No. 2 Former Mobile Oil Containment Building Boreholes with Compounds in Soil or Groundwater that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Soil Human Health SLs	Soil Leaching to Groundwater SLs	Soil Ecological SLs	Groundwater Drinking Water SLs
C2CB-08	<SLs	<SLs	<SLs	Diesel Range Organics
C2CB-09	<SLs	<SLs	<SLs	Not encountered
C2CB-10	<SLs	<SLs	<SLs	<SLs

C2CB-13	<SLs	<SLs	<SLs	Not encountered
C2CB-14	<SLs	<SLs	<SLs	Not encountered

Notes:

SLs = screening levels; <SLs = does not exceed screening levels

9.2 Copco No. 2 Underground Storage Tanks

9.2.1 Background

At the Copco No. 2 Development, AECOM identified one 9,000-gallon UST located at 19305 Daggett Road, Hornbrook, California, based on a June 27, 1996, letter from Marsh & McLennan to PacifiCorp. No further information was available on the specific location of the UST or whether it has been removed. Hazmat Figure Sheet 8 from the Phase I ESA (AECOM 2018) depicts the former fuel pumps in an area east northeast of the Copco No. 2 Maintenance Building and just below Daggett Road (Figure 9-1); roughly the area between the power pole and the road grader in Photograph 9-2.

Photograph 9-2. Looking Southeast at Approximate Location of Copco No. 2 Underground Storage Tanks (Jacobs 2021a)

9.2.2 Field Activities

On March 1, 2022, the planned soil borings for Copco No. 2 Underground Storage Tanks were marked and cleared for utilities as discussed in Section 2 (Figure 9-1). Geophysical surveys were performed over a 1.2 acre area to determine if a UST was present. The geophysical surveys did not identify anomalies indicative of USTs, but did result in the relocation of soil boring C2UT-06 approximately 5 feet to north of the planned location to avoid an underground utility.

On March 7, 8, and 9, 2022, a hand auger or DPT rig was used to advance soil borings C2UT-01 through C2UT-9 for logging purposes and for collection of soil samples if soil was determined to have been impacted by TPHs. Because the DPT rig met refusal, several soil borings could not be advanced to the planned borehole depth of 20 feet bgs. Recovered soil cores from each boring were logged and screened with a PID. Except for soil from boring C2UT-02, recovered soil from each boring was determined to not

have been impacted by TPHs (no staining, odor, or PID readings greater than 50 ppmv). Consequently, soil samples were not collected from borings C2UT-01 and C2UT-03 through C2UT-09 (Table 9-3).

At soil boring C2UT-02, a moist, black clay with a slight organic odor was observed at a depth of 11.5 to 12 feet bgs. The PID reading from both of these depth intervals was 0 ppmv. Because the soil at these depths had a slight organic odor, soil samples were collected from each of these depths and from a depth of 17 to 18 feet bgs, just below the deepest interval with black soil. Four step-out borings (C2UT-02N, C2UT-02S, C2UT-02E, C2UT-02W) were also advanced to depths of 20 feet bgs (Figure 9-1).

Impacted soil was not observed in soil borings C2UT-02N, C2UT-02S, C2UT-02E, which were respectively advanced 10 feet north, south, and east of boring C2UT-02. Boring C2UT-02W, located 10 feet west of soil boring C2UT-02, contained soil with staining and odor at a depth 15 to 17 feet bgs, so a soil sample was collected from this interval (Table 9-3). The soil boring was advanced to collect a soil sample from beneath the impacted soil. Groundwater was encountered at a depth of 20 feet bgs. A temporary well was installed near the end of the day (Section 2), was allowed to stabilize overnight, and static water was measured in the well at a depth of 13.4 feet bgs the following day. A grab groundwater sample was collected with a disposable bailer and was submitted for analysis of the same analytes as the soil samples (Table 9-3).

On May 3, 2022, five step-out soil borings (C2UT-10 through C2UT-14) were marked and cleared for utilities (Section 2). Soil borings C2UT-10 through C2UT-13 were located 15 feet from soil boring C2UT-02W, and soil boring C2UT-14 was located near soil boring C2UT-05 in an effort to establish presumed upgradient groundwater conditions from soil borings C2UT-02 and C2UT-02W (Figure 9-1). On May 9 and 10, 2022, the step-out soil borings were advanced with a DPT rig. Continuous soil cores were collected to refusal or the planned drilling depth of 25 feet bgs, and soil samples were collected at 5-foot intervals (Table 9-3). Temporary wells were installed within borings C2UT-10, C2UT-12, C2UT-13, and C2UT-14 (Section 2); groundwater was allowed to stabilize, and then groundwater samples were collected from each temporary well (Table 9-3).

Table 9-3. Copco No. 2 Underground Storage Tanks Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2UT-01	None	12.5	HA/DPT	Refusal encountered at 12.5 feet bgs in each of three attempts; not impacted by TPH, no samples collected
C2UT-02	11.5-12, 15-16, 17-18	20	HA/DPT	Black clay with organic odor at 11.5-12 feet bgs and 15-16 feet bgs
C2UT-02E	None	20	HA/DPT	Not impacted by TPH;[a] no soil samples collected
C2UT-02N	None	20	HA/DPT	Not impacted by TPH; no soil samples collected
C2UT-02S	None	20	HA/DPT	Not impacted by TPH; no soil samples collected
C2UT-02W	15.5-17.5	25	HA/DPT	Black clay at 15.5-17.5 feet bgs; initial DTW at 20.0 feet bgs; after stabilization, DTW at 13.4 feet bgs; collected groundwater sample
C2UT-03	None	16.5	HA/DPT	Refusal at 16.5 feet bgs; not impacted by TPH, no soil samples collected
C2UT-04	None	20	HA/DPT	Not impacted by TPH; no soil samples collected

Table 9-3. Copco No. 2 Underground Storage Tanks Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2UT-05	None	20	HA/DPT	Not impacted by TPH; no samples collected; DTW at 19 feet bgs
C2UT-06	None	20	HA/DPT	Not impacted by TPH; no soil samples collected
C2UT-07	None	20	HA/DPT	Not impacted by TPH; no soil samples collected
C2UT-08	None	20	HA/DPT	Not impacted by TPH; no soil samples collected
C2UT-09	None	11	HA/DPT	Not impacted by TPH; no soil samples collected
C2UT-10	0-5, 5-10, 10-15, 15-17	17	HA/DPT	After stabilization, DTW at 15.6 feet bgs; collected groundwater sample
C2UT-11	0-5, 5-10	10	HA/DPT	Refusal at 10 feet bgs or shallower on each of four attempts
C2UT-12	0-5, 5-10, 10-15, 15--20, 20-21	25	HA/DPT	Initial DTW at 21.5 feet bgs; after stabilization, DTW at 13.2 feet bgs; collected groundwater sample
C2UT-13	0-5, 5-10, 10-15, 15--20, 20-25	25	HA/DPT	DTW at 23.5 feet bgs; collected partial groundwater sample, very low flow
C2UT-14	0-5, 5-10, 10-15, 15--20, 20-23	23	HA/DPT	Moist soil observed 11 to 13 feet bgs with dry soil beneath; DTW at 9.6 feet bgs; collected groundwater sample

Notes:

[a] The phrase "not impacted by TPH" in this table row and others means soil was not stained, odorous, or characterized by PID readings greater than 50 ppmv.

bgs = below ground surface

DPT = direct-push technology

DTW = depth to water

HA = hand auger

PID = photoionization detector

ppmv = parts per million by volume

TPH = total petroleum hydrocarbon

9.2.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Soil from borings C2UT-10 through C2UT-14 and black soil from borings C2UT-02 and C2UT-02W did not exceed site-specific screening levels, except for soil at a depth of 15 to 20 feet bgs in boring C2UT-12, which exceeded the leaching to groundwater screening level for 1,2,3-trichloropropane (Table 9-4).

Groundwater from borings C2UT-02W, C2UT-13, and C2UT-14 exceeded the screening level for DRO. The groundwater screening level for several PAHs was exceeded in a groundwater sample collected from boring C2UT-12, and the groundwater screening level for chloroform was exceeded in the groundwater sample collected from boring C2UT-14 (Table 9-4).

Table 9-4. Copco No. 2 Underground Storage Tanks Borehole Summary Boreholes with Compounds in Soil or Groundwater that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Soil: Human Health SLs	Soil: Leaching to Groundwater SLs	Soil: Ecological SLs	Water: Groundwater SLs
C2UT-02	<SLs	<SLs	<SLs	Not encountered
C2UT-02W	<SLs	<SLs	<SLs	Diesel Range Organics
C2UT-10	<SLs	<SLs	<SLs	<SLs
C2UT-11	<SLs	<SLs	<SLs	Not encountered
C2UT-12	<SLs	1,2,3-trichloropropane	<SLs	Benzo[a]anthracene, Benzo[a]pyrene, Benzo[b]fluoranthene, Dibenz(a,h)anthracene
C2UT-13	<SLs	<SLs	<SLs	Diesel Range Organics
C2UT-14	<SLs	<SLs	<SLs	Diesel Range Organics, Chloroform

Notes:
SLs = screening levels
<SLs = does not exceed screening levels

9.3 Site-Specific Risk Assessment

The risk assessment treated these two sites as a single exposure area because of their proximity, inter-relatedness, and similar COPCs. The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

9.3.1 Human Health Risk Assessment

9.3.1.1 Data Evaluation

No human health COPCs were identified in soil at either site. The human health COPCs in groundwater at both sites are DRO, chloroform, and PAHs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene] (Appendix F).

9.3.1.2 Exposure Assessment

Default DTSC and EPA exposure parameters were used (Appendix F).

9.3.1.3 Toxicity Assessment

No COPCs required surrogate toxicity values.

9.3.1.4 Human Health Risk Assessment Results

For the hypothetical future residential scenario, based on drinking water use of groundwater, the cumulative ELCR is 2E-04 which exceeds the EPA risk management range (Table 9-5). The primary

contributors to the ELCR are benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene. The HI is 1 which does not exceed the target HI of 1.

9.3.1.5 Uncertainty Discussion

In general, the types of COPCs identified are considered representative of potential releases within the combined sites. Because the maximum COPC concentrations detected in groundwater were used as the EPCs, the risks are potentially overestimated.

9.3.1.6 Human Health Risk Assessment Conclusions

Estimated cancer risks for hypothetical future residents exposed to groundwater exceed the target ELCR of 1E-06. The primary contributors to the ELCR are benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene. No human health COPCs were identified in soil at the Copco No. 2 Former Mobile Containment Building or at the Copco No. 2 Underground Storage Tanks.

9.3.2 Leaching to Groundwater Evaluation

The soil leaching COPC at the two sites is 1,2,3-trichloropropane (Appendix F). Groundwater was encountered between 13.4 and 23.5 feet bgs when sampling at the sites. The Klamath River is located approximately 90 feet northwest of the Copco No. 2 Former Mobile Oil Containment Building and is approximately 28 feet lower in elevation.

1,2,3-trichloropropane was only detected in 1 of 24 samples (6.5E-04 at C2UT-12 from 15 to 20 feet bgs). Because the EPC of 1,2,3-trichloropropane (1.0E-04 mg/kg) is less than the soil leaching screening level (1.1E-04 mg/kg) and the soil leaching value protective of groundwater (58 mg/kg) as a nondrinking water resource (Table 9-6), the migration to groundwater pathway is considered incomplete.

9.3.3 Ecological Risk Assessment

The streamlined ERA for the Copco No. 2 Former Mobile Oil Containment Building and the Copco No. 2 Underground Storage Tanks was conducted on a sample-by-sample basis and all risk estimates are presented in Appendix G, Table G-13 (Mobile Oil Containment Building), Table G-14 (Underground Storage Tanks), and Table G-18 (chemical group HIs). Neither site was retained for further evaluation because there were no exceedances of the No Effect ESLs (Step 1) or chemical group exceedances (Table G-18). Therefore, no analytes in site soil were retained for risk management analysis based on potential risks to ecological receptors.

9.4 Recommended Actions

No further action is recommended for site soil at the two sites because:

1) There are no documented spills or releases at these sites.
2) There was no evidence of a UST at these sites based on the absence of anomalies indicative of USTs within the boundaries of the geophysical survey (Figure 9-1).
3) Soil cores from initial and subsequent borings were not observed to be impacted by TPHs or other compounds.
4) Soil samples from all borings, with the exception of one soil sample from boring C2UT-12, did not contain COPCs at concentrations greater than soil screening levels for the sites. Soil from boring C2UT-12 did not contain detectable concentrations of 1,2,3-trichloropropane in the primary soil sample, but 1,2,3-trichloropropane was detected above the soil screening level in the duplicate soil

sample. However, 1,2,3-trichloropropane was not retained for risk management in the human health, leaching to groundwater, and ecological risk assessments.

The only COPCs retained for human health consideration in groundwater were the following PAHs detected in one groundwater sample collected from boring C2UT-12: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene. No further action is recommended for groundwater at the two sites because:

1) PAH concentrations in the duplicate groundwater sample collected from boring C2UT-12 are less than the groundwater screening levels.
2) These four PAHs were not detected above soil screening levels in samples collected from boring C2UT-12 or any other borings advanced at each site.
3) Groundwater samples collected from five nearby temporary wells (C2CB-08, C2CB-10, C2UT-02W, C2UT-10, and C2UT-14) did not contain detectable concentrations of these PAHs.

For these reasons, the Copco No. 2 Former Mobile Oil Containment Building and Copco No. 2 Underground Storage Tanks sites are recommended for closure (Section 1.2).

Table 9-5. Human Health Risk Estimates for COPCs in Groundwater at Copco No. 2 Former Mobile Oil Containment Building and Underground Storage Tanks

							Hypothetical Future Resident			
Type	COPC	CAS	MDC (µg/L)	EPC (µg/L)	EPC Basis	Background Related?	RBC Cancer (µg/L)	RBC Non-cancer (µg/L)	Cancer Risk	Non-cancer Hazard Index

10. Copco No. 2 Burn Pit

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Copco No. 2 Burn Pit.

10.1 Background

The *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020a) identified an approximate 10-foot by 10-foot burn pit about 1,600 feet south of the Copco No. 2 Powerhouse and up the hill from Copco 2 Village. Wood pallets, tree branches and limbs, and other debris were observed to be piled on the burn pit (Photograph 10-1). A pile of soil was located on the northwest edge of the burn pit and may be where burned ash and soil was periodically scraped. An old drum and metal pipe were found near the pit. Additional site features include a backhoe, wood beams, a pile of broken concrete, and two areas of bare soil and what appeared to be stressed vegetation (Figure 10-1). Current PacifiCorp policy allows for burning of vegetation and untreated lumber when an open burn permit is utilized; however, it is not known what may have been historically disposed of through use of the burn pit. Soil at the site is generally classified as Lassen-Kuck complex, stony (USDA 2021).

Photograph 10-1. Copco No. 2 Burn Pit, Backhoe, and Drum Looking Northeast (PacifiCorp 2021)

10.2 Field Activities

On March 2, 2022, the planned soil borings for the Copco No. 2 Burn Pit were marked and cleared for utilities. Planned soil borings C2BP-01, C2BP-04, C2BP-07, and C2BP-12 were adjusted so that they would be advanced closer to their respective site features of concern (Table 10-1). The backhoe and material to be burned were no longer present.

On March 9 and 10, 2022, soil borings C2BP-01 through C2BP-12 were advanced via hand auger. Soil samples were collected at 0.5-foot intervals and at depths ranging from 0.5 foot to 6 feet bgs (Table 10-1).

Table 10-1. Copco No. 2 Burn Pit Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
C2BP-01	0-0.5, 1-1.5, 2-2.5	2.5	HA	At stressed vegetation
C2BP-02	0-0.5, 1-1.5, 2-2.5	2.5	HA	Adjacent to wood pile
C2BP-03	0-0.5, 1-1.5, 2-2.5	2.5	HA	In wood pile
C2BP-04	0-0.5, 1-1.5, 2-2.5	2.5	HA	At depression from backhoe
C2BP-05	0-0.5, 1-1.5, 2-2.5	2.5	HA	In area of dark stained soil under backhoe area
C2BP-06	0-0.5, 1-1.5, 2-2.5	2.5	HA	Adjacent to concrete rubble
C2BP-07	0-0.5, 1-1.5, 2-2.5	2.5	HA	Adjacent to drum remnants
C2BP-08	0-0.5, 1-1.5, 2-2.5, 3-3.5	3.5	HA	In pile of soil next to burn pit
C2BP-09	0-0.5, 1-1.5, 2-2.5, 3-3.5	3.5	HA	East edge of burn pit
C2BP-10	0-0.5, 1-1.5, 2-2.5, 3-3.5, 5.5-6	6.0	HA	Center of burn pit
C2BP-11	0-0.5, 1-1.5, 2-2.5, 3-3.5	3.5	HA	South edge of burn pit
C2BP-12	0-0.5, 1-1.5, 2-2.5	2.5	HA	At stressed vegetation

Notes:
bgs = below ground surface
HA = hand auger

10.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for dioxin, arsenic, cobalt, lead, DRO, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene. The leaching to groundwater screening level was also exceeded for DRO, diethylphthalate, naphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, and indeno(1,2,3-cd)pyrene. Ecological screening levels were exceeded for dioxin, benzyl alcohol, bis(2-ethylhexyl) phthalate, benzo(a)anthracene, benzo(b)fluoranthene, chrysene, pyrene, and various metals (Table 10-2, Figure 10-1).

Table 10-2. Copco No. 2 Burn Pit Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
C2BP-01	<SLs	<SLs	Cobalt, Selenium
C2BP -02	Cobalt	<SLs	Cobalt, Selenium

Table 10-2. Copco No. 2 Burn Pit Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
C2BP-03	Cobalt	<SLs	Cobalt, Selenium
C2BP-04	Cobalt	<SLs	Boron, Cadmium, Cobalt, Selenium
C2BP-05	Cobalt, DRO	DRO	Boron, Cobalt, Selenium Bis(2-ethylhexyl) phthalate
C2BP-06	Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Dibenzo(a,h)anthracene, Indeno(1,2,3-cd)pyrene	Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Chrysene, Naphthalene, Indeno(1,2,3-cd)pyrene	Cobalt, Selenium, Benzo(a)anthracene, Benzo(b)fluoranthene, Chrysene, Pyrene
C2BP-07	<SLs	Diethylphthalate	Cobalt, Selenium
C2BP-08	Dioxin, Arsenic, Lead	Naphthalene	Dioxin, Antimony, Arsenic, Boron, Cadmium, Cobalt, Copper, Lead, Selenium, Zinc
C2BP-09	Cobalt	Naphthalene	Dioxin, Boron, Cobalt, Selenium
C2BP-10	<SLs	Naphthalene	Dioxin, Boron, Cobalt, Selenium, Benzyl Alcohol
C2BP-11	Dioxin	<SLs	Dioxin, Boron, Cobalt, Selenium
C2BP-12	Cobalt, Iron	<SLs	Boron, Cobalt, Selenium

Notes:
SLs = screening levels
<SLs = does not exceed screening levels

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

10.4 Site-Specific Human Health Risk Assessment

10.4.1 Data Evaluation

The human health COPCs in soil at the Copco No. 2 Burn Pit are 2,3,7,8-TCDD TEQ, PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and indeno(1,2,3-cd)pyrene), and metals (arsenic, cadmium, cobalt, iron, and lead) (Appendix F).

10.4.2 Exposure Assessment

Default DTSC and EPA exposure parameters were used (Appendix F) with modifications for the future recreational user (Section 3.1.2). Construction workers are not potential future receptors at the Copco No. 2 Burn Pit site because the site is outside the proposed development area and there is no infrastructure requiring maintenance or repair; therefore, the scenario was not evaluated.

10.4.3 Toxicity Evaluation

Except for the surrogate toxicity values used for dioxins, as presented in Section 3.1.3, no COPCs requiring surrogate toxicity values were identified.

10.4.4 Human Health Risk Assessment Results

The HHRA analysis indicates that for the future passive recreational use, the cumulative ELCRs are 1E-05 for surface soil and 8E-06 for mixed-zone soil (Table 10-3), which exceed the EPA point of departure of 1E-06, but do not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). Arsenic is a primary contributor to the ELCRs in both surface soil and mixed-zone soil. Benzo(a)pyrene and dibenzo(a,h)anthracene are also primary contributors to the ELCR in surface soil. The HIs are 3 for surface soil and 2 for mixed-zone soil, which exceed the target HI of 1. The only primary contributor to the HI in both surface and mixed-zone soil is arsenic. Arsenic is considered naturally occurring because the EPCs in surface soil (17.1 mg/kg) and mixed-zone soil (13.2 mg/kg) are below the background concentration of 19 mg/kg. Excluding naturally occurring metals, the cumulative ELCR does not exceed 1E-06 in mixed-zone soil and the HIs do not exceed 1 in both surface soil and mixed-zone soil. In surface soil the ELCR, excluding naturally occurring metals, is 5E-06.

For the hypothetical future residential scenario, the cumulative ELCRs are 2E-04 for surface soil and 1E-04 for mixed-zone soil (Table 10-3). Arsenic, 2,3,7,8-TCDD TEQ, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene are primary contributors to the ELCRs in both surface soil and mixed-zone soil. Benzo(a)anthracene and benzo(a)pyrene are also primary contributors to the ELCR in surface soil. The HIs are 49 for surface soil and 37 for mixed-zone soil, which exceed the target HI of 1. The primary contributors to the HI in both surface and mixed-zone soil are arsenic and DRO. Excluding naturally occurring metals, the cumulative ELCRs are 9E-05 for surface soil and 1E-05 for mixed-zone soil, and the HIs are 6 for surface soil and 4 for mixed-zone soil, which exceed the target HI of 1.

The EPCs of lead are 12.79 mg/kg in surface soil and 15.59 mg/kg in mixed-zone soil, which are below the DTSC Note 3 values (DTSC 2022a) for residential and industrial exposure scenarios (80 mg/kg and 500 mg/kg, respectively). Therefore, risk from exposure to lead does not exceed target risk criteria.

10.4.5 Uncertainty Discussion

In general, the number and location of soil samples are considered adequate for risk assessment purposes, and the type of COPCs and EPCs identified are considered representative of potential releases within the Copco No. 2 Burn Pit. Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated.

The highest concentration of DRO (6,700 mg/kg) was detected at sample location C2BP-05 where the residential RBC (960 mg/kg) was exceeded at 0 to 0.5 foot bgs but not in deeper samples. Because DRO at C2BP-05 is within the stained soil below where the backhoe was parked, the concentration likely biases the EPC high, and risk from DRO is likely overestimated.

The highest concentration of 2,3,7,8-TCDD TEQ was detected at sample location C2BP-08 (pile of soil adjacent to burn pit) where the residential RBC was exceeded at all depths. Because dioxins at C2BP-08 have not been delineated vertically, the resulting risk assessment data gap causes uncertainty in the risk results.

The highest concentrations of PAHs were detected at sample location C2BP-06 where the residential RBCs were exceeded at 0 to 0.5 foot bgs but not in deeper samples. PAHs have not been delineated laterally, resulting in a risk assessment data gap that causes uncertainty in the risk results.

10.4.6 Human Health Risk Assessment Conclusions

Estimated cancer risks for future passive recreational users and hypothetical future residents potentially exposed to COPCs in soil exceed the EPA point of departure of 1E-06 but does not exceed the EPA risk management range. The site-related primary contributors to ELCRs are 2,3,7,8-TCDD TEQ and PAHs.

Noncancer HIs exceed the target HI of 1 for future passive recreational users and hypothetical future residents. The site-related primary contributors to the His are 2,3,7,8-TCDD TEQ at the burn pit and DRO in the soil where the backhoe had been parked.

The vertical extent of dioxin contamination at C2BP-08 (burn pit) has not been delineated. The lateral extent of PAH contamination at C2BP-06 (concrete rubble) has not been delineated resulting in uncertainty in the HHRA results.

10.5 Leaching to Groundwater Evaluation

The soil leaching COPCs at the Copco No. 2 Burn Pit are DRO, PAHs [i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and naphthalene], and diethylphthalate (Appendix F).

Groundwater was not encountered during sampling and depth to groundwater is not known. The Klamath River is located approximately 1,200 feet northwest of the Copco No. 2 Burn Pit and is approximately 230 feet lower in elevation.

Because EPCs of benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and diethylphthalate are less than the soil leaching SLs and the soil leaching values protective of groundwater as a nondrinking water resource (Table 10-4), the migration to groundwater pathway is considered incomplete for these COPCs. EPCs of DRO at the backhoe location, benzo(a)anthracene and chrysene at the concrete rubble, and naphthalene at the burn pit exceed the soil leaching SLs for drinking water (Table 10-4).

10.5.1 Diesel Range Organics

DRO was detected at a concentration exceeding the soil leaching screening level of 1,100 mg/kg in only 1 of 9 samples. At location C2BP-05, DRO exceeds the soil leaching screening level at 0 to 0.5 foot bgs (6,700 mg/kg) but DRO concentrations are less than the soil leaching screening level at 1 to 1.5 feet bgs (59 mg/kg) and 2 to 2.5 feet bgs (88 mg/kg). The vertical extent is delineated, and because only the shallowest surface soil concentration exceeds (by less than an order of magnitude) the soil leaching screening level but not deeper samples, infiltration is not occurring and the migration to groundwater pathway is considered incomplete for DRO.

10.5.2 Benzo(a)anthracene

Benzo(a)anthacene was detected at a concentration exceeding the soil leaching screening level of 0.51 mg/kg in only 1 of 40 samples. At location C2BP-06, benzo(a)anthacene exceeds the soil leaching screening level at 0 to 0.5 foot bgs (20 mg/kg) but was not detected at 1 to 1.5 feet bgs and 2 to 2.5 feet bgs. The vertical extent is delineated. Because only the shallowest surface soil concentration exceeds the soil leaching screening level but the deeper samples do not, infiltration is not occurring and the migration to groundwater pathway is considered incomplete for benzo(a)anthacene.

10.5.3 Chrysene

Chrysene was detected at a concentration exceeding the soil leaching screening level of 1.6 mg/kg in only 1 of 40 samples. At location C2BP-06, chrysene exceeds the soil leaching screening level at 0 to 0.5 foot bgs (23 mg/kg) but was not detected at 1 to 1.5 feet bgs and does not exceed the soil leaching screening level at 2 to 2.5 feet bgs (0.033 mg/kg). The vertical extent is delineated. Because only the shallowest surface soil concentration exceeds the soil leaching screening level but the deeper samples do not, infiltration is not occurring and the migration to groundwater pathway is considered incomplete for chrysene.

10.5.4 Naphthalene

Naphthalene was detected at concentrations exceeding the soil leaching screening level of 0.042 mg/kg in 5 of 40 samples at the following locations:

- C2BP-06: Naphthalene exceeds the soil leaching screening level at 0 to 0.5 foot bgs (0.85 mg/kg) but was not detected at 1 to 1.5 feet bgs and 2 to 2.5 feet bgs. The vertical extent is delineated. Because only the shallowest surface soil concentration exceeds the soil leaching screening level but the deeper samples do not, infiltration is not occurring and the migration to groundwater pathway is considered incomplete at C2BP-06.
- C2BP-08: Naphthalene exceeds the soil leaching screening level at 0 to 0.5 foot bgs (0.16 mg/kg), 1 to 1.5 feet bgs (0.42 mg/kg) and 3 to 3.5 feet bgs (0.12 mg/kg). Because samples were not collected deeper than 3 feet bgs, vertical extent is not delineated.
- C2BP-10: Naphthalene exceeds the soil leaching screening level at 0 to 0.5 foot bgs (0.082 mg/kg) but does not exceed the soil leaching screening level at 1 to 1.5 feet bgs (0.011 mg/kg) and was not detected at 3 to 3.5 feet bgs. The vertical extent is delineated. Because only the shallowest surface soil concentration exceeds the soil leaching screening level but the deeper samples do not, infiltration is not occurring and the migration to groundwater pathway is considered incomplete at C2BP-10.

10.5.5 Leaching to Groundwater Evaluation Conclusions

Except for naphthalene at location C2BP-08 (burn pit), the migration to groundwater pathway is incomplete for all identified leaching to groundwater COPCs at the Copco No. 2 Burn Pit. The concentrations of naphthalene at sample location C2BP-08 exceed the soil leaching screening level and, because the vertical extent of the naphthalene contamination has not been delineated, there remains a potential threat to groundwater.

10.6 Ecological Risk Assessment

The streamlined ERA completed for the Copco No. 2 Burn Pit was conducted on a sample-by-sample basis. Sample-specific risk estimates are presented in Appendix G, Table G-15 and Table G-18, and results are summarized in Table 10-5.

Several metals, dioxins, PAHs, and SVOCs exceeded their respective No Effect ESLs (Step 1) and Low Effect ESLs (Step 2). Vanadium, 2,3,7,8-TCDD TEQ for birds, and 2,3,7,8-TCDD TEQ Mammal all exceeded EcoPRGs assuming 100 percent site use. 2,3,7,8-TCDD TEQ Mammal also exceeded the EcoPRG when the AUF was applied and was retained for risk management analysis. Vanadium HQs were below 1 when then AUF was applied, and the maximum detected concentration of vanadium did not exceed the regional background level. All sample-by-sample chemical group HIs were equal to or less than 1 without application of AUFs and less than 1 with application of AUFs.

The weight of evidence rationale for each analyte is summarized as follows:

- Weight of Evidence Code "A" – Chemical is retained for risk management analysis for ecological receptors. Some individual sample results exceeded the No Effect ESL, Low Effect ESL, and EcoPRGs for birds and mammals under the assumption of 100 percent site use as well as when the site-specific AUF was applied (mammals). This weight of evidence rationale applies to 2,3,7,8-TCDD TEQ for birds and mammals.
- Weight of Evidence Code "B" – Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. This weight of evidence rationale applies to the following analytes:
  - Metals: antimony, barium, chromium, cobalt, manganese, mercury, and thallium
  - PAHs: acenaphthene, benzo(b)fluoranthene, chrysene, and pyrene
  - SVOCs: 1,3-dichlorobenzene and benzyl alcohol
- Weight of Evidence Code "C" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use. This weight of evidence rationale applies to the following analytes:
  - Metals: arsenic, boron, cadmium, copper, lead, selenium, and zinc
  - PAHs: benzo(a)anthracene
  - SVOCs: bis (2-ethylhexyl) phthalate
- Weight of Evidence Code "D" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird EcoPRG assuming 100 percent site use. However, there are no exceedances of the EcoPRGs when the site-specific AUFs are applied, and the maximum detected result does not exceed the BTV. This weight of evidence rationale applies to vanadium.
- Weight of Evidence Code "E" – Chemical group is not retained for risk management for ecological receptors. All sample-by-sample chemical group HIs were equal to or less than 1 without application of AUFs and less than 1 with application of AUFs. This weight of evidence rationale applies to the following:
  - PAHs: low molecular weight PAHs, high molecular weight PAHs

2,3,7,8-TCDD TEQ in soil was retained for risk management based on potential risks to ecological receptors.

10.7 Recommended Actions

Concentrations of DRO in surface soil at the location where the backhoe had been parked (C2BP-05) exceed the HHRA hazard quotient of 1 for hypothetical future residents. Concentrations of PAHs in surface soil of the concrete rubble area (C2BP-06) exceed the ELCR of 1E-06 for the passive recreational users and hypothetical future residents, and the lateral extent has not been delineated. At the burn pit (C2BP-08 through C2BP-11), concentrations of a dioxin (2,3,7,8-TCDD) exceed risk-based criteria for human health and ecological receptors and concentrations of naphthalene exceed soil leaching criteria and have not been vertically delineated.

The top 1 foot of soil at the backhoe area and the concrete rubble area are recommended to be excavated and disposed of offsite (Figure 10-2). Confirmation sampling will be performed on the remaining soil in the sidewalls and at the bottom of the excavation at the backhoe parking location to verify DRO

concentrations are less than 960 mg/kg and at the concrete rubble area to verify PAHs are less than the residential RBCs (benzo(a)anthracene [1.1 mg/kg], benzo(a)pyrene [0.11 mg/kg], and benzo(b)fluoranthene [1.1 mg/kg]).

The burn pit and adjacent soil pile will be excavated to a depth of 4 feet bgs and soil disposed of offsite (Figure 10-2). Confirmation sampling will be performed on the remaining soil in sidewalls and on the bottom of the excavation to verify dioxin and naphthalene concentrations are less than human health and ecological screening levels. All excavated areas will be backfilled with clean material, graded, compacted to match surrounding grade, and revegetated.

Notes:

[a] Soil Leaching SL calculated per the formula in Section 3.1.2.

Target groundwater concentrations from Table S-3 in SFRWQCB (2019).

Groundwater Category Drinking Water Resource - protective of groundwater that is a source of drinking water AND protective of discharge of groundwater to surface water and subsequent effects on aquatic life.

-- = not applicable

µg/L = micrograms per kilogram

$atm\text{-}m^3/mole\text{-}^oK$ = standard atmosphere meters cubed per mole

CAS = Chemical Abstract Service

cm^3/g = cubic centimeters per gram

COPC = constituent of potential concern

EPC = exposure point concentration for soil data from all depths

ESL = environmental screening level, SFRWQCB 2019

Koc = organic carbon partition coefficient

MDC = maximum detected concentration; used because there are too few detected values to calculate a UCL

mg/kg = milligrams per kilogram

SL = screening level

UCL = upper confidence limit on the mean

Notes:

Number presented under each step identifies the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.

Yes = Retained for Risk Management

-- - no samples had exceedances; analyte not retained for further evaluation.

AUF = area use factor

BTV = background threshold value

DXN = dioxin/furan

EcoPRG = ecological preliminary remedial goal

ESL = ecological screening level

HQ = hazard quotient

PAH = polynuclear aromatic hydrocarbon

REC = recognized environmental condition

RSL = regional screening level

SVOC = semivolatile organic compound

Weight of Evidence Rationale Codes:

A = Chemical is retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, Low Effect ESL, and EcoPRGs for birds and mammals under the assumption of 100 percent site use as well as when the site-specific AUF was applied (mammals).

B = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL or EcoPRGs for birds or mammals.

C = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals even under the assumption of 100 percent site use.

D = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect RSL as well as the Bird EcoPRG assuming 100 percent site use; however, there are no exceedances of the EcoPRGs when the site-specific AUFs are applied and the maximum detected result does not exceed the BTV.

11. Iron Gate Shooting Range

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Iron Gate Shooting Range.

11.1 Background

A shooting range is located approximately 2,000 feet east of the Iron Gate Dam (Figure 11-1). During a reconnaissance survey conducted by PacifiCorp and Jacobs on June 21, 2021, shell casings and clay targets were observed on the ground while walking the gun range. The gun range surface soils are turned over regularly using a bulldozer and worked soil piles are visible (Photograph 11-1). There was some evidence of cans and other items being used for target practice down range of the shooting stations. Soil within the Iron Gate Shooting Range is generally classified as Lassen-Kuck complex, stony (USDA 2021).

Photograph 11-1. Iron Gate Shooting Range Looking Southeast Toward Short-range Target Berm (Jacobs 2022a)

11.2 Field Activities

On May 2, 2022, the planned soil borings for the Iron Gate Shooting Range were marked and cleared for utilities. Soil borings IGSR-01 and IGSR-02 were moved approximately 20 feet away from areas with large rocks. Soil boring IGSR-05 was moved approximately 20 feet north and into a drainage swale to assess the

potential for migration of contaminants from stormwater runoff. Soil borings IGRS-11, IGRS-12, IGRS-16, IGSR-18, and IGRS-28 were moved approximately 30 to 60 feet and into areas with broken pieces of clay targets. Soil borings IGRS-23 and IGRS-24 were moved approximately 20 feet to avoid large pieces of concrete debris within the mound of concrete.

On March 3, 5, 6, and 13, 2022, soil borings IGSR-01 through IGSR-28 were advanced via hand auger and DPT rig. Soil samples were collected at 0.5-foot intervals and at depths ranging from 0.5 foot to 6 feet bgs (Table 11-1). Borings IGSR-01, IGSR-04, and IGSR-27 met refusal during installation despite two or more attempts to reach the depth proposed in the California SIWP. Samples were collected above the refusal depth in accordance with the California SIWP. Recovery at the lower depths of boreholes installed with the DPT rig experienced poor recovery. Consequently, the sample interval was extended in the deep boreholes to collect adequate soil volume for laboratory analysis.

Table 11-1. Iron Gate Shooting Range Borehole Summary

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
IGSR-01	0-0.5, 0.5-1	1.0	HA	Refusal at 1.0 feet bgs; at base of hill behind long-range target

IGSR-27	0-0.5, 0.5-1.5, 2.5-3.5	5.5	HA/DPT	Refusal at 5.5 feet bgs
IGSR-28	0-0.5, 1-1.5	1.5	HA	Moved to area with clay targets

Notes:
-- = no comment
bgs = below ground surface
HA = hand auger
DPT = direct-push technology

11.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for lead, antimony, cobalt, iron, magnesium, and benzo(a)pyrene. No compounds exceeded the leaching to groundwater screening levels. Ecological screening levels were exceeded for metals, most commonly lead, boron, cobalt, and selenium (Table 11-2, Figure 11-1).

Table 11-2. Iron Gate Shooting Range Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
IGSR-01	<SLs	<SLs	Boron, Cobalt, Copper, Selenium
IGSR-02	<SLs	<SLs	Lead, Boron, Cobalt, Copper, Selenium
IGSR-03	Lead, Magnesium	<SLs	Lead, Antimony, Boron, Cobalt, Copper, Magnesium, Selenium, Zinc
IGSR-04	Cobalt, Iron	<SLs	Antimony, Cobalt, Copper, Selenium
IGSR-05	<SLs	<SLs	Boron, Cobalt, Selenium
IGSR-06	<SLs	<SLs	Boron, Cobalt, Selenium

Table 11-2. Iron Gate Shooting Range Boreholes with Compounds that Exceed the California Site Investigation Work Plan Screening Levels

IGSR-22	<SLs	<SLs	Boron, Cobalt, Selenium
IGSR-23	<SLs	<SLs	Boron, Selenium
IGSR-24	<SLs	<SLs	Boron, Cobalt, Selenium
IGSR-25	<SLs	<SLs	Cobalt, Selenium
IGSR-26	<SLs	<SLs	Cobalt, Selenium
IGSR-27	<SLs	<SLs	Boron, Cobalt, Selenium
IGSR-28	<SLs	<SLs	Boron, Cobalt, Selenium

Notes:
SLs = screening levels
<SLs = does not exceed screening levels

Boreholes IGSR-03 and IGSR-19 had concentrations of lead that were ten times greater than the most restrictive ecological screening level and two other boreholes had concentrations of lead that exceeded the ecological screening level (Table 11-3). Given the location of these boreholes in the long- and short-range target berms, these results are not surprising.

Table 11-3. Iron Gate Shooting Range Boreholes with Lead that Exceed the California Site Investigation Work Plan Screening Levels

Sample Name[a]	Analyte	Result (mg/kg)	Human Health SL (mg/kg)	Leaching to Groundwater SL (mg/kg)	Ecological SL (mg/kg)
IGSR-02-0.0-0.5	Lead	60	80	N/A	34
IGSR-03-0.0-0.5	Lead	1,100 J	80	N/A	34
IGSR-03-0.0-0.5-FD	Lead	840 J	80	N/A	34
IGSR-03-1.0-1.5	Lead	1,400	80	N/A	34
IGSR-19-0.0-0.5	Lead	8,900	80	N/A	34
IGSR-19-1.0-1.5	Lead	1,400	80	N/A	34
IGSR-19-2.0-2.5	Lead	410	80	N/A	34
IGSR-21-0.0-0.5	Lead	160	80	N/A	34

Notes:

[a] Sample names are a composite of the site code (IGSR), borehole number (e.g., 02), and sample depth range (e.g., 0.0-0.5) in feet bgs.

FD = field duplicate

J = estimated value that is less than the reporting limit but greater than the method detection limit

N/A = not applicable; there are no leaching screening levels for lead

SL = screening level

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

11.4 Site-Specific Human Health Risk Assessment

11.4.1 Data Evaluation

The human health COPCs in soil at the Iron Gate Shooting Range are benzo(a)pyrene and metals (antimony, arsenic, cobalt, iron, lead, and manganese) (Appendix F).

11.4.1.1 Exposure Assessment

Default DTSC and the EPA exposure parameters were used (Appendix F) with modifications for the future passive recreational user (Section 3.1.2). Additional site-specific parameters were assumed for the future construction worker exposure scenario based on the input requirement in the RSL calculator. For general construction activities (excavation and grading), "soil-other construction activities" were selected for the RSL calculator, and the following conservative site-specific parameters were entered as inputs:

- Total area: 13 acres (conservative estimate of the limits of SIWP)
- Area dozed: 6.5 acres (conservative estimate of half the limits of SIWP)
- Area graded: 6.5 acres (conservative estimate of half the limits of SIWP)
- Area excavated: 26,000 square meters (conservative estimate of half the limits of SIWP)
- Dozing and grading blade length: 3.7 meters (based on standard equipment)
- Average depth of excavation: 3 meters

Areas are considered to be conservative because they include the total of the limits of SIWP (Figure 11-1), which are larger than impacted long- and short-range target areas.

11.4.2 Toxicity Evaluation

No COPCs required surrogate toxicity values.

11.4.3 Human Health Risk Assessment Results

The HHRA analysis indicates that for the future passive recreational user and future construction worker scenarios, the cumulative ELCRs and HIs do not exceed 1E-06 and 1, respectively, for surface soil and mixed-zone soil (Table 11-4).

For the hypothetical future residential scenario, the cumulative ELCRs do not exceed 1E-06 for surface soil and mixed-zone soil. The HI is 2 for both surface soil and mixed-zone soil, which exceed the target HI of 1. The primary contributors to the HI in both surface and mixed-zone soil are cobalt and iron, and manganese; however, individual HQs do not exceed 1. Cobalt, iron, and manganese are naturally occurring metals and not considered to be site related. Excluding cobalt, iron, and manganese, the HI is 0.2 for both surface soil and mixed-zone soil, less than the target HI of 1.

The EPCs of lead are 501 mg/kg in surface soil and 421 mg/kg in mixed-zone soil, which exceed the DTSC Note 3 value (DTSC 2022a) for the residential exposure scenario (80 mg/kg). The EPC of lead in surface soil also exceeds the DTSC Note 3 value for the industrial exposure scenario (500 mg/kg), which is used to evaluate risk to the future construction worker.

Therefore, risks from exposure to lead for the future passive recreational user, the future construction worker, and the hypothetical future residential exceed DTSC Note 3 (DTSC 2022a) target criteria.

11.4.4 Uncertainty Discussion

In general, the number and location of soil samples are considered adequate for risk assessment purposes, and the type of COPCs and EPCs identified are considered representative of potential releases within the Iron Gate Shooting Range. Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated.

11.4.5 Human Health Risk Assessment Conclusions

Risks from exposure to lead exceed DTSC Note 3 (DTSC 2022a) target criteria for the future construction worker at soil borings IGSR-03 and IGSR-19, and for the future passive recreational user and hypothetical future resident at soil borings IGSR-03, IGSR-19, and IGSR-21 (Table 11-3).

Estimated risks to future passive recreational users, future construction workers, and hypothetical future residents from potential exposure to non-lead COPCs in soil do not exceed target risk criteria at the Iron Gate Shooting Range.

11.5 Leaching to Groundwater Evaluation

No soil leaching COPCs were identified at the Iron Gate Shooting Range (Appendix F).

11.6 Ecological Risk Assessment

The streamlined ERA completed for the Iron Gate Shooting Range was conducted on a sample-by-sample basis. Sample-specific risk estimates are presented in Appendix G, Table G-16 and Table G-18, and results are summarized in Table 11-5.

Several metals exceeded their respective No Effect ESLs (Step 1) and Low Effect ESLs (Step 2). Lead exceeded the bird and mammal EcoPRGs and vanadium exceeded the bird EcoPRG assuming 100 percent site use; however, vanadium did not exceed background BTV. The AUFs for birds and mammals at the Iron Gate Shooting Range remained 1 as the site size exceeds the home range size for the most sensitive representative species (hermit thrush and vagrant shrew). Lead was retained for risk management analysis for ecological receptors. Sample-by-sample chemical group HIs were less than 1 for all chemical groups with and without application of AUFs.

The weight of evidence rationale for each analyte is summarized as follows:

- Weight of Evidence Code "A" – Chemical is retained for risk management analysis for ecological receptors. Detected results exceeded the No Effect ESL, Low Effect ESL, regional background concentrations, as well as bird and mammal EcoPRGs. This code applies to lead.
- Weight of Evidence Code "B" – Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. In addition, there were no exceedances of metal BTVs (where available). This weight of evidence code applies to barium, chromium, cobalt, mercury, and thallium.
- Weight of Evidence Code "C" – Chemical is not retained for risk management analysis for ecological receptors. One sample had concentrations exceeding BTVs but there were no exceedances of the No Effect ESL, Low Effect ESL, bird or mammal EcoPRGs. This weight of evidence code applies to silver.
- Weight of Evidence Code "D" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use). This weight of evidence code applies to antimony, boron, copper, manganese, selenium, and zinc.
- Weight of Evidence Code "E" – Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL as well as the Low Effect EcoPRG for birds (100 percent site use). However, none of the samples exceeded the BTV. This weight of evidence code applies to vanadium.

With the exception of lead, no analytes in site soil were retained for risk management based on potential risks to ecological receptors.

11.7 Recommended Actions

Lead exceeds human health criteria at IGSR-03, IGSR-19, and IGSR-21 and exceeds ecological risk criteria at these locations and at IGSR-02. No soil leaching COPCs were identified at the Iron Gate Shooting Range.

This is an informal shooting range that is used occasionally by the general public and is not subject to daily use by multiple shooters. The shooting range will be closed when the Iron Gate Dam is demolished. The results and conclusions of this sampling event are likely indicative of site conditions after the shooting range is closed.

Based on the results of this sampling, PacifiCorp proposes that the lead-contaminated soil at the long-range and short-range targets be addressed as follows:

- Excavate to a depth of 2 feet bgs in a 75-foot by 110-foot area at the long-range target and 6 vertical feet up the hillside behind the target (Figure 11-2).
- Excavate the northeast one-third of the berm at the short-range target to match the surrounding ground surface and excavate to a depth of 1 foot bgs in a 50-foot by 50-foot area in front of the short-range target berm (Figure 11-2).
- Perform confirmation sampling on excavation sidewalls and bottom to verify lead concentrations in remaining soil are less than 34 mg/kg.
- Dispose of the excavated material offsite.
- Backfill the excavation with clean material and grade to match surrounding land surface.

The KRRC will be disposing of debris from the removal of Iron Gate Dam on top of the shooting range. The placement of thousands of cubic yards of material in this location as part of the dam removal project will result in a low likelihood of wildlife ingesting lead shot/bullet fragments. If agreed upon by PacifiCorp, the KRRC, and the State of California, no removal action may be required.

Table 11-4. Human Health Risk Estimates for COPCs in Soil at Iron Gate Shooting Range

							Future Recreational User				Future Construction Worker				Hypothetical Future Resident			
Type	COPC	CAS	MDC (mg/kg)	EPC (mg/kg)	EPC Basis	Background Related? Notes:
Number presented under each step identifes the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.
Yes = Retained for Risk Management
-- - no samples had exceedances; analyte not retained for further evaluation.
AUF = area use factor
BTV = background threshold value
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient
REC = recognized environmental condition
RSL = regional screening level

Weight of Evidence Rationale Codes:

A = Chemical is retained for risk management analysis for ecological receptors. Detected results exceeded the No Effect ESL, Low Effect RSL, regional background concentrations, as well as bird and mammal EcoPRGs.

B = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL or EcoPRGs for birds or mammals. In addition, there were no exceedances of metal BTVs (where available).

C = Chemical is not retained for risk management analysis for ecological receptors. One sample had concentrations exceeding background; however, there were no exceedances of the No Effect ESL, Low Effec ESL, bird or mammal EcoPRGs.

D = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use).

E = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL as well as the Low Effect EcoPRG for birds (100 percent site use). However, none of the samples exceeded the BTV.

12. Iron Gate Hatchery Burn Pit

This section summarizes the field activities and analytical laboratory results and provides the risk assessments and recommended next steps for closure of the Iron Gate Hatchery Burn Pit.

12.1 Background

An approximate 20- by 20-feet burn pit (Photograph 12-1) is located approximately 100 feet south of Bogus Creek and approximately 400 east of the Iron Gate Hatchery settling ponds (Figure 12-1). Soil within the Iron Gate Hatchery Burn Pit is generally classified as Lassen-Kuck complex, stony (USDA 2021).

Photograph 12-1. Iron Gate Burn Pit Looking Southeast (Jacobs 2022a)

In February 2018, a soil investigation was conducted to assess the presence of potential contaminants that may have been introduced from the burning of wood pallets and other wastes at the site (AECOM 2019). Three soil borings were advanced to a depth of 1.5 feet bgs within the burn pit., and two soil samples were collected from each boring. The soil samples were analyzed for CAM 17 metals, mercury, TPH-G, TPH-D, TPH-MO (with and without silica gel clean up), VOCs, SVOCs, and PCBs. Concentrations of metals were less than background concentrations for the Cascade Range (ODEQ 2013); VOCs, SVOCs, and PCBs were not detected. TPH-g, TPH-d, and TPH-MO were detected at concentrations that are less than the SFRWQCB (2019) environmental screening levels. Acetone, di-n-butyl phthalate, and bis[2-ethylhexyl] phthalate were also detected, but the detections were considered by AECOM (2019) to be laboratory contaminants.

Because dioxins and furans were not analyzed under the Phase II performed by AECOM (2019) and because the burn pit may have been utilized after the Phase II was performed, additional sampling was recommended in the California SIWP.

12.2 Field Activities

On May 2, 2022, the planned soil borings for Iron Gate Hatchery Burn Pit were marked and cleared for utilities. Visually impacted areas were delineated with a GPS unit and select soil borings were moved to be better located within visually impacted areas of the burn pit.

The burn pit was confirmed to be approximately 20-feet by 20-feet, with slightly varying slopes on the northern and southern sides of the pit. Within the pit, burned material/debris was observed from surface grade to approximately 0.5 foot bgs and then grading to native material (hard clay with gravel) at approximate depths of 0.5 foot to 1.75 feet bgs. Burn material was also observed to have been pushed or scraped from the footprint of the burn pit into a berm on the south side. The volume of burn material within the burn pit is estimated to be 7.5 cubic yards, and the volume of burned material piled outside the burn pit is estimated to be 22.25 cubic yards.

Additional soil sample locations were marked based on observations that the burn pit had well-delineated northern, eastern, and western sidewalls with minimal amounts of accumulated burn material and that a southern sidewall had likely been created by scraping burn material towards the south (Photograph 12-1). Consequently, an additional composite sample (IGBP-C2) of visually impacted material was collected from three locations along the southern sidewall, and a second soil boring (IGBP-02) was advanced in the southwestern corner of the burn pit (Figure 12-1). On May 2, 2022, two composite samples were collected from the burn pit. The composite samples were composed of visually impacted burn material from ground surface to 0.5 foot bgs. Composite sample IGBP-C1 was collected from four locations within the burn pit, and composite sample IGBP-C2 was collected from three locations along the southern wall of the burn pit (Figure 12-1). Soil borings IGBP-01 and IGBP-02 were advanced by hand auger to depths of 1.75 to 0.5 foot bgs, respectively, where refusal was met.

On May 13, 2022, a DPT rig was used to advance soil boring IGBP-01 to a depth of 6 feet bgs. Two adjacent soil borings were advanced to obtain a sufficient volume of material for laboratory analysis at various depths (Table 12-1). As a result of poor soil recovery, the sample intervals were changed from 3.0-3.5 to 2.5-3.5 feet bgs and from 5.5-6.0 to 5.0-6.0 feet bgs. Groundwater was not observed in any of the soil borings.

Table 12-1. Iron Gate Burn Pit Boreholes

Borehole ID	Sample Intervals (feet bgs)	Depth (feet)	Method	Comments
IGBP-01	0-0.5, 0.5-1.5, 2.5-3.5, 5-6	6.0	HA/DPT	Located in center of burn pit, hand auger met refusal at 1.75 feet bgs
IGBP-02	0-0.5	0.5	HA	To delineate southwest corner
IGBP-C1	0-0.5	0.5	HA	Composite sample collected from four locations of the floor of the burn pit
IGBP-C2	0-0.5	0.5	HA	Composite sample collected from three locations of the south wall of the burn pit

Notes:
bgs = below ground surface; HA = hand auger; DPT = direct-push technology

12.3 Analytical Results

The analytical results were compared to the site-specific screening levels (Appendix D) established in the California SIWP. Human health screening levels were exceeded for DROs, arsenic, and benzene. Leaching to groundwater screening levels were exceeded for benzene, diethylphthalate, hexachlorobutadiene, and naphthalene. Ecological screening levels were exceeded for dioxin, boron, cobalt, selenium, bis(2-ethylhexyl) phthalate, and hexachlorobutadiene (Table 12-2, Figure 12-1).

Table 12-2. Iron Gate Burn Pit Boreholes with Compounds in Soil that Exceed the California Site Investigation Work Plan Screening Levels

Borehole	Human Health SLs	Leaching to Groundwater SLs	Ecological SLs
IGBP-01	Diesel Range Organics	Benzene, Diethylphthalate	Dioxin, Boron, Cobalt, Selenium, Bis (2-ethylhexyl) phthalate
IGBP-02	Arsenic	Benzene, Hexachlorobutadiene, Naphthalene	Dioxin, Antimony, Arsenic, Boron, Cobalt, Copper, Lead, Selenium, Zinc, Hexachlorobutadiene
IGBP-C1	<SLs	Benzene	Dioxin, Boron, Cobalt, Selenium
IGBP-C2	Arsenic, Benzene	Benzene, Naphthalene	Dioxin, Antimony, Arsenic, Boron, Cobalt, Copper, Selenium

Notes:
SLs = screening levels
<SLs = does not exceed screening levels

The COPCs carried forward into the risk assessments are based on the risk assessment screening criteria discussed in Sections 3.1 (human health), 3.2 (soil leaching to groundwater), and 3.3 (ecological).

12.4 Site-Specific Human Health Risk Assessment

12.4.1 Data Evaluation

The human health COPCs in soil at the Iron Gate Hatchery Burn Pit are DRO, benzene, and metals (antimony, arsenic, cobalt, and iron) (Appendix F). Antimony is included because concentrations of antimony exceed both the background value and the risk-based screening level based on a HQ of 0.1 (Section 3.1). Cobalt and iron are included because they do not have background values and because concentrations exceed their risk-based screening level based on a HQ of 0.1.

12.4.2 Exposure Assessment

Default DTSC and EPA exposure parameters were used (Appendix F) with modifications for the future passive recreational user (Section 3.1.2). Additional site-specific parameters were assumed for the future construction worker exposure scenario based on the input requirement in the RSL calculator. For general construction activities (excavation and grading), "soil-other construction activities" were selected for the RSL calculator, and the following conservative site-specific parameters were entered as inputs:

- Total area: 0.5 acre (minimum input for RSL calculator)
- Area dozed: 0.04 acre (conservative estimate of site size)
- Area graded: 0.04 acre (conservative estimate of site size)
- Area excavated: 150 square meters (assumes entire site is excavated)

- Dozing and grading blade length: 3.7 meters (based on standard equipment)
- Average depth of excavation: 3 meters

12.4.3 Toxicity Evaluation

No COPCs required surrogate toxicity values.

12.4.4 Human Health Risk Assessment Results

For the future passive recreational scenario, the cumulative ELCR is 4E-05 for both surface soil and mixed-zone soil (Table 12-3), which exceeds the EPA point of departure of 1E-06, but does not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). Arsenic is the primary contributor to the ELCRs. The HI is 13 for both surface soil and mixed-zone soil, which exceed the target HI of 1. The only primary contributor to the HI in both surface and mixed-zone soil is arsenic.

For the future construction worker scenario, the cumulative ELCR is 4E-06 for both surface soil and mixed-zone soil (Table 12-3), which exceeds the EPA point of departure of 1E-06, but does not exceed the EPA risk management range (1E-06 to 1E-04) (EPA 1989). Arsenic is the only primary contributor to the ELCRs. The HIs are less than 1 for both surface soil and mixed-zone soil.

For the hypothetical future residential scenario, the cumulative ELCR is 8E-04 for both surface soil and mixed-zone soil (Table 12-3), which exceeds the EPA risk management range (1E-06 to 1E-04) (EPA 1989). Arsenic is the only primary contributor to the ELCRs. The HI is 212 for both surface soil and mixed-zone soil. The only primary contributor to the HI is arsenic.

12.4.5 Uncertainty Discussion

Because samples were collected at suspected release locations, the exposure area data are likely biased high and the risks potentially overestimated.

Because of the few samples collected, a 95 percent UCL could not be calculated for arsenic, and the maximum detected concentration was used as the EPC, which overestimates the risks. Arsenic exceeded the background concentration of 19 mg/kg in two shallow surface soil samples collected from 0 to 0.5 foot bgs (33 mg/kg at IGBP-02 and 86 mg/kg in composite sample IGBP-C2).

12.4.6 Human Health Risk Assessment Conclusions

Estimated cancer risks and HIs for future passive recreational users, future construction workers, and hypothetical future residents potentially exposed to COPCs in soil exceed target risks of 1E-06 and 1, respectively. The primary contributor to the ELCRs and HIs is arsenic.

12.5 Leaching to Groundwater Evaluation

The soil leaching COPCs at the Iron Gate Hatchery Burn Pit are benzene, hexachlorobutadiene, naphthalene, and diethylphthalate (Table 12-2, Appendix F). Groundwater was not encountered during sampling and depth to groundwater is not known. Bogus Creek is located approximately 100 feet northwest of the Iron Gate Hatchery Burn Pit and is approximately 12 feet lower in elevation.

Because EPCs of hexachlorobutadiene and diethylphthalate are less than the soil leaching screening levels and the soil leaching values protective of groundwater as a nondrinking water resource (Table 12-4), the migration to groundwater pathway is considered incomplete for these COPCs.

EPCs of benzene and naphthalene exceed the soil leaching screening levels protective of drinking water (Table 12-4). However, the EPCs of benzene (0.2 mg/kg) and naphthalene (0.043 mg/kg) are less than the soil leaching values protective of groundwater as a nondrinking water resource (2.8 mg/kg and 6 mg/kg, respectively) (Table 12-4).

12.5.1 Benzene

Benzene was detected at a concentration exceeding the soil leaching screening level of 0.025 mg/kg in 4 of 7 samples. Exceedances ranged from 0.037 mg/kg to 0.37 mg/kg and only occurred in shallow surface soil samples collected from 0 to 0.5 foot bgs. Benzene was not detected in the deeper samples collected from 0.5 foot to 1.5 feet bgs, 2.5 to 3.5 feet bgs, and 5 to 6 feet bgs at location IGBP-01. Since the site is very small, the deeper samples collected at IGBP-01 are considered representative of the site subsurface. The vertical extent is delineated. Because only the shallowest surface soil concentrations exceed the soil leaching screening level but not deeper samples, infiltration is not occurring and the migration to groundwater pathway is considered incomplete for benzene.

12.5.2 Naphthalene

Naphthalene was detected at a concentration exceeding the soil leaching screening level of 0.042 mg/kg in 1 of 7 samples (0.075 mg/kg at location IGBP-02 in shallow surface soil sample collected from 0 to 0.5 foot bgs). Naphthalene did not exceed the soil leaching screening level in the deeper samples collected from 0.5 foot to 1.5 feet bgs, 2.5 to 3.5 feet bgs, and 5 to 6 feet bgs at location IGBP-01. Since the site is very small, the deeper samples collected at IGBP-01 are considered representative of the site subsurface. The vertical extent is delineated. Because only one shallow surface soil sample exceeds the soil leaching screening level but not deeper samples, infiltration is not occurring and the migration to groundwater pathway is considered incomplete for naphthalene.

12.5.3 Leaching to Groundwater Evaluation Conclusions

The migration to groundwater pathway is incomplete for the soil leaching COPCs (benzene, hexachlorobutadiene, naphthalene and diethylphthalate) at the Iron Gate Hatchery Burn Pit.

12.6 Ecological Risk Assessment

The streamlined ERA completed for the Iron Gate Fish Hatchery Burn Pit was conducted on a sample-by-sample basis. Sample-specific risk estimates are presented in Appendix G, Table G-17 and Table G-18, and results are summarized in Table 12-5.

Several metals, 2,3,7,8-TCDD TEQ Mammal, bis(2-ethylhexyl) phthalate, and hexachlorobutadiene exceeded their respective No Effect ESLs (Step 1) and Low Effect ESLs (Step 2). Vanadium and 2,3,7,8-TCDD TEQ Mammal exceeded EcoPRGs assuming 100 percent site use but did not exceed when the AUF was applied. The maximum detected concentration of vanadium did not exceed the regional background level. Sample-by-sample chemical group HIs were less than 1 for all chemical groups with and without application of AUFs.

The weight of evidence rationale for each analyte is summarized as follows:

- Weight of Evidence Code “A” – Chemical is not retained for risk management for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. In addition, there were no exceedances of the BTV (metals). This weight of evidence rational applies to the following:
  - Metals: barium, cobalt, manganese, mercury, and thallium

  - SVOC: hexachlorobutadiene

- Weight of Evidence Code "B" – Chemical is not retained for risk management for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect ESL or EcoPRGs for birds or mammals. This weight of evidence rational applies to antimony.
- Weight of Evidence Code "C" – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect ESL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use). This weight of evidence rationale applies to the following:
  - Metals: arsenic, boron, chromium, copper, lead, selenium, and zinc
  - SVOC: bis (2-ethylhexyl) phthalate
- Weight of Evidence Code "D" – Chemical is not retained for risk management for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect ESL as well as the Bird EcoPRG assuming 100 percent site use; however, there were no exceedances of the AUF-adjusted EcoPRGs. This weight of evidence rationale applies to the following:
  - Metals: vanadium
  - Dioxins: 2,3,7,8-TCD TEQ Mammal

No analytes in site soil were retained for risk management based on potential risks to ecological receptors.

12.7 Recommended Actions

The leaching to groundwater evaluation indicated that the migration to groundwater pathway is incomplete for the soil leaching COPCs and the ERA indicated that site COPCs detected above ecological screening levels do not need to be retained for risk management purposes. However, the HHRA results indicate that estimated cancer risks and HIs exceed target risks of 1E-06 and 1, respectively, for future passive recreational users, future construction workers, and hypothetical future residents because there is arsenic in soil from surface grade to a depth of 0.5 foot bgs and in the berm pushed up at the back of the pit.

The top 0.5 foot of soil and berm material within the limits of the burn pit are recommended to be excavated and disposed of offsite (Figure 12-2). The estimated volume of soil and burned material to be excavated from the burn pit is approximately 7.5 cubic yards, and the estimated volume of soil and burned material to be excavated around the outside the burn pit is approximately 22.25 cubic yards. Excavating will be considered complete when confirmation samples from the excavation floor and four sidewalls indicate that arsenic concentrations do not exceed background levels (19 mg/kg).

Table 12-3. Human Health Risk Estimates for COPCs in Soil at Iron Gate Hatchery Burn Pit

							Future Recreational User				Future Construction Worker				Hypothetical Future Resident

Notes:

[a] Soil Leaching SL calculated per the formula in Section 3.1.2.

Target groundwater concentrations from Table S-3 in SFRWQCB (2019).

Groundwater Category Drinking Water Resource - protective of groundwater that is a source of drinking water AND protective of discharge of groundwater to surface water and subsequent effects on aquatic life.

-- = not applicable

µg/L = micrograms per kilogram

$atm\text{-}m^3/mole\text{-}^oK$ = standard atmosphere meters cubed per mole

CAS = Chemical Abstract Service

cm^3/g = cubic centimeters per gram

COPC = constituent of potential concern

EPC = exposure point concentration for soil data from all depths

ESL = environmental screening level, SFRWQCB 2019

Koc = organic carbon partition coefficient

MDC = maximum detected concentration; used because there are too few detected values to calculate a UCL

mg/kg = milligrams per kilogram

SL = screening level

UCL = upper confidence limit on the mean

Table 12-5. Weight of Evidence for Ecological Receptors at Iron Gate Fish Hatchery Burn Pit

			Background Comparison	Step 1 Screening Evaluation	Step 2 Refined Evaluation	Step 3 Site-Specific Evaluation				Step 4 Weight of Evidence

Iron Gate Fish Hatchery Burn Pit	VOC	Hexachlorobutadiene	--	1	--	--	--	--	--	No	A

Notes:

Number presented under each step identifes the number of samples collected from 0 to 6 feet bgs that exceeded the indicated screening level or EcoPRG.

-- - no samples had exceedances; analyte not retained for further evaluation.

AUF = area use factor

BTV = background threshold value

DXN = dioxin/furan

EcoPRG = ecological preliminary remedial goal

ESL = ecological screening level

HQ = hazard quotient

PAH = polynuclear aromatic hydrocarbon

REC = recognized environmental condition

RSL = regional screening level

SVOC = semivolatile organic compound

VOC = volatile organic compound

Weight of Evidence Rationale Codes:

A = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL or EcoPRGs for birds or mammals. In addition, there were no exceedances of the BTV (metals).

B = Chemical is not retained for risk management analysis for ecological receptors. Although some individual sample results exceeded the No Effect ESL, none of the detected results exceeded the Low Effect RSL or EcoPRGs for birds or mammals.

C = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded both the No Effect ESL and the Low Effect RSL; however, none of the results exceeded the site-specific EcoPRGs for birds or mammals (100 percent site use).

D = Chemical is not retained for risk management analysis for ecological receptors. Some detected results exceeded the No Effect ESL and Low Effect RSL as well as the Bird EcoPRG assuming 100 percent site use; however, there were no exceedances of the AUF-adjusted EcoPRGs.

13. Iron Gate Hatchery Settling Ponds

The Iron Gate Hatchery is located at 8638 Lakeview Road in Hornbrook, California, about one-third mile downstream of Iron Gate Dam. The hatchery is owned by PacifiCorp and is operated by the California Department of Fish and Wildlife. Two settling ponds (Photograph 13-1) receive wastewater from hatchery operations in the incubation building and from the raceways when they are being cleaned. Soil within the Iron Gate Hatchery Settling Ponds site is generally classified as Lassen-Kuck complex, stony (USDA 2021).

Photograph 13-1. Iron Gate Hatchery Settling Ponds (Jacobs 2021a)

13.1 Field Activities

Field activities at the Iron Gate Hatchery Settling Ponds were not recommended in the California SIWP (Jacobs 2022a) based on the analytical results from a prior study of settling pond sediment (Watercourse 2018). The results of the study, performed at North Coast Regional Water Quality Control Board request, indicated that pond sediment did not contain metals greater than background concentrations or VOCs, SVOCs, pesticides, and PCBs that exceeded laboratory detection limits. The sediment in the settling ponds is not regulated federally or under the California Code of Regulations.

13.2 Recommended Actions

The Iron Gate Hatchery Settling Ponds are recommended for closure (Section 1.2) based on the following:

- Pond sediment did not contain metals that exceeded background concentrations.
- VOCs, SVOCs, pesticides, and PCBs were not detected in pond sediment.
- The pond sediment is not regulated federally or under the California Code of Regulations.

14. Summary of Recommendations

This section summarizes the recommendations for further action at the 11 sites assessed according to the California SIWP in February, March, and May of 2022. Based on the analytical results and risk assessments, five sites are recommended for closure under a process developed between PacifiCorp, the KRRC, and the State of California, thereby satisfying the requirements of the Agreement. Six sites are recommended for removal action through excavation and offsite disposal of impacted soil and through collection of soil samples from the excavation floors and sidewalls to confirm that all impacted soil has been removed (Table 14-1).

14.1 Sites Recommended for Closure

The following sites are recommended for closure (Section 1.2):

- **Copco No. 1 Dynamite Cave**: The site is recommended for closure because residual explosives and explosive residue were not observed or detected in the cave.
- **Copco No. 1 Debris Pile/Scrap Yard**: The site is recommended for closure because there were no remaining constituents of concern upon evaluation of the analytical results against screening levels and completion of the risk assessments.
- **Copco No. 2 Former Mobile Oil Containment Building and Underground Storage Tanks**: These two sites are recommended for closure because there are no documented spills or releases at either site and because there is no evidence of an existing UST based on the results of the geophysical survey. No further action is required for soil at these sites because:
  - Soil cores from initial and redrilled borings were not observed to be impacted by TPHs (soil was not stained, odorous, or characterized by PID readings greater than 50 ppmv) or other compounds.
  - Soil samples from all site borings did not contain COPCs at concentrations above site-specific soil screening levels.
  - There were no retained COPCs in soil from the risk assessments.

  No further action is required for groundwater at these sites because:
  - COPCs exceeded screening levels in one groundwater sample, but COPCs did not exceed screening levels in the duplicate sample.
  - The same COPCs did not exceed screening levels in groundwater samples from five other temporary wells.
  - The COPC exceedances in a single groundwater sample are not representative of groundwater at the site.
- **Iron Gate Hatchery Settling Ponds**: The settling ponds are recommended for closure because pond sediment is not state or federally regulated and because COPCs were previously not detected or were detected at less than background concentrations.

14.2 Sites Recommended for Removal Action

Consistent with the assessment conducted per the California SIWP and analysis in this report, the following six sites are recommended for further action (Table 14-1; Figures 6-2, 7-2, 8-2, 10-2, 11-2, and 12-2):

- **Copco No. 2 Wood-Stave Penstock:** Excavate and dispose of soil from beneath the former penstock (Figure 6-2) after it is decommissioned and removed by the KRRC. Unless further investigation is conducted following removal of the penstock, an approximate 50,000-square-foot area will be excavated to an approximate depth of 1 foot bgs or refusal from bedrock or boulders.
- **Copco No. 2 Wood Pile:** Excavate and dispose of soil from beneath Wood Pile No. 2 (Figure 7-2). An approximate 1,500-square-foot area will be excavated in 2-foot lifts to an approximate depth of 6 feet bgs. No remedial activities are recommended for Wood Piles No. 1 and No. 3, based on the results of the risk assessments.
- **Copco No. 2 Powerhouse Transformer Fire:** Excavate and dispose of soil from the southeast corner of the powerhouse to a depth of 2 feet bgs (Figure 8-2). An approximate 50-square-foot area will be excavated to an approximate depth of 2 feet bgs (4 cy^3 total).
- **Copco No. 2 Burn Pit:** Excavate and dispose of soil from the immediate vicinity of the burn pit, the concrete rubble area, and where the backhoe was parked (Figure 10-2). An approximate 2,300-square-foot area will be excavated to approximate depths of 1 and 4 feet bgs (255 cy^3 total).
- **Iron Gate Shooting Range:** Excavate and dispose of soil from defined areas of the shooting range (Figure 11-2). An approximate 10,750-square-foot area will be excavated to approximate depths of 1 and 2 feet bgs (700 cy^3 total). Alternatively, because this site will be used for disposal of material from the removal of Iron Gate Dam, which will completely bury the site, the likelihood of wildlife ingesting lead shot/bullet fragments will be low. If agreed upon by PacifiCorp, the KRRC, and the State of California, no removal action may be required.

- **Iron Gate Hatchery Burn Pit:** Excavate and dispose of soil from and surrounding the burn pit (Figure 12-2). An approximate 1,155-square-foot area will be excavated to an approximate depth of 0.5 foot bgs (21 cy^3 total).

PacifiCorp will prepare removal action plans for excavation and offsite disposal of impacted soil at each site. The removal action plans will at a minimum address proper excavation technique and safety, confirmation sampling for excavation floors and sidewalls, soil management methods, waste management and disposal of soil, and backfill and compaction requirements.

A site removal action report will be prepared upon completion of the removal actions. The report will contain a summary of the remedial activities performed, waste manifests that document proper transport and disposal of excavated soil, and tables and figures of the analytical results from confirmation sampling for the contaminants of concern at each site. This site removal action report is intended to be the site closeout report that will provide the necessary documentation to close these sites per the process developed between PacifiCorp, the KRRC, and the State of California.

Table 14-1. Summary of Recommended Future Actions

Site/REC	Constituents of Concern after Risk Assessments	Approximate Areal Extent of Impacted Soil (square feet)	Approximate Depth of Impacted Soil (feet)	Approximate Volume of Impacted Soil (cubic yards)	Recommended Future Action
Copco No. 1 Dynamite Cave	Not applicable	N/A	N/A	N/A	Close site. Explosives/explosive residue confirmed to be absent from the cave.
Copco No. 1 Debris Pile/Scrap Yard	None	N/A	N/A	N/A	Close site. No COPCs were retained for risk assessment.
Copco No. 2 Wood-Stave Penstock	PCP and PAHs (benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene)	50,000	1	1,852	Prepare a remedial action plan for excavation and offsite disposal of soil beneath the penstock. (Note that excavating will be difficult over this large area and that this site may be a good site to further assess after the penstock is removed.)
Copco No. 2 Wood Pile	PCP	1,500	6	333	Prepare a remedial action plan for excavation and offsite disposal of soil beneath Wood Pile No. 2.
Copco No. 2 Powerhouse Transformer Fire	DRO and PCB (Aroclor 1262)	200	2	15	Prepare a remedial action plan for excavation and offsite disposal of soil in the immediate vicinity of soil boring at C2TF-01.
Copco No. 2 Former Mobile Oil Containment Building and Underground Storage Tanks	PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene)	N/A	N/A	N/A	Close site. PAHs detections in groundwater were in one temporary well (C2UT-12) out of six total temporary wells. The duplicate groundwater sample from temporary well C2UT-12 did not contain three of the PAHs detected in the primary sample, and the fourth PAH was detected below the groundwater screening level. The four PAHs were not detected above screening levels in soil samples collected from boring C2UT-12 or and other site borings.

Table 14-1. Summary of Recommended Future Actions

Site/REC	Constituents of Concern after Risk Assessments	Approximate Areal Extent of Impacted Soil (square feet)	Approximate Depth of Impacted Soil (feet)	Approximate Volume of Impacted Soil (cubic yards)	Recommended Future Action
Copco No. 2 Burn Pit	Dioxin (2,3,7,8-TCDD), naphthalene, and PAHs	2,316	1 & 4	255	Prepare a remedial action plan for excavation and offsite disposal of soil in the immediate vicinity of the backhoe, burn pit, and concrete rubble areas.
Iron Gate Shooting Range	Lead	10,750	1 & 2	700	Prepare a remedial action plan for excavation and offsite disposal of soil within defined areas of the shooting range or if acceptable to the KRRC and the State of California, allow the site to be covered with debris from dam removal in lieu of removing impacted soil.
Iron Gate Hatchery Burn Pit	Arsenic	1,155	0.5	21	Prepare a remedial action plan for excavation and offsite disposal of soil in the immediate vicinity of the burn pit.
Iron Gate Hatchery Settling Ponds	None	N/A	N/A	N/A	Close site. Pond sediment is not regulated federally or by the state; COPCs either were not detected or were detected at less than background concentrations.

Notes:

COPCs = constituents of potential concern

DRO = diesel range organics

N/A = not applicable

PAH = polynuclear aromatic hydrocarbons

PCP = pentachlorophenol

WATER WELL PERMIT

PERMIT# W22026

APPLICANT (Must be licensed contractor or property owner and must be legible)

Name Jacobs - c/o David Poley

Address 1000 Wilshire Blvd., Suite 2100

Mailing Address 1000 Wilshire Blvd., Suite 2100

City, State, Zip Code Los Angeles, CA 90017

Telephone (310) 795-2445

Well Type		Annular Seal Depth
☐	Domestic	20 foot minimum
☐	Industrial	50 foot minimum
☐	Agricultural	20 foot minimum
☐	Public	50 foot minimum
☐	Monitoring	as approved #
☐	Deepening	n/a
☐	Destruction	n/a
■	Soil bores	as approved # 17
☐	Other	as approved

Minimum thickness of annular space seal is 2 inches

A PLOT PLAN MUST be submitted on an 81/2 x 11 sheet of paper. It must include all property boundaries, waterways, roads, septic systems and structures, location of the proposed well in relationship to the property boundaries.

Permit Conditions

- Well driller must provide a minimum of 24 hours notice prior to installing or placing annular seal.
- All wells must be drilled under a C-57 license
- Applicant/well driller is responsible for maintaining all setbacks as approved by on location map below including a minimum of 100 feet from any established on-site sewage disposal location.
- Owner and well contractor are required to submit a completed well log within 30 days of well completion.
- This permit does not guarantee issuance of any other development permits or land use requests for this property.
- This permit expires six months from the date of issuance.

Owner/Contractor Signatures

☒ Drawings ☐ Other:

Method of Shipment:

Delivered to Counter

☐ Under separate cover via

Quantity	Description
1	Check totaling $1,200.00
1	Original Water Well Permit W22027 and Application to Amend Water Well Permit WW027
1	Table 1A: Additional Permitting Fees Applicable to Water Well Permit W22027
1	Table 2A: Soil Boring Locations
1	Figure 1A identifying the soil boring locations

Remarks:

With this transmittal, Jacobs requests an amendment to existing Siskiyou Count Water Well Permit W22027. Soil borings authorized under Water Well Permit W22027 (33 total) were advanced and abandoned along with four additional soil borings (C2UT-02N, C2UT-02S, C2UT-02E, and C2UT-02W) in March 2022. Siskiyou County Inspectors oversaw advancement and abandonment of these borings.

Through this transmittal, Jacobs requests authorization to advance 12 additional borings under Siskiyou County Water Well Permit W22027. Also included in this request are the fees for advancement and abandonment of the 4 additional soil borings (C2UT-02N, C2UT-02S, C2UT-02E, and C2UT-02W) in March 2022.

Under the amended permit, Jacobs will oversee J&H Drilling Co., Inc. (J&H Drilling, C-57 License No. 740854) as they hand auger and/or advance the 12 additional direct push technology (DPT) soil borings. Applicable fees the additional soil borings are summarized in Table 1A; the boring locations are summarized in Table 2A. Figure 1A depicts the borings already advanced or planned to be advanced (16 total).

Jacobs will obtain a DigAlert permit for each soil boring at least 48 hours prior to drilling. A subcontracted third party subcontractor will additionally clear each soil boring for subsurface utilities through use of geophysical survey methods. If a utility is determined to be present within 5 feet of a planned soil boring, then the soil boring will be moved at least 5 feet away from the identified utility, and the new soil boring coordinate will be documented.

J&H Drilling will hand auger the entire borehole diameter to a depth of 5 feet below ground surface prior to drilling, which will commence after Jacobs visually confirms the absence of a utility within each borehole. Upon completion of soil sampling, J&H Drilling will abandon each boring with hydrated bentonite and restore the ground surface to original surface grade.

If you have any questions regarding the service application requests, please contact me at (310) 795-2445 or at david.poley@jacobs.com.

Best Regards,

David Poley/Jacobs

Customer warrents that the waste petroleum products being received do not contain any contaminants including, without limitation, pesticides, chlorinated solvents at total concentrations greater than 1000 PPM, PCB's greater than 2 PPM, or any other material classified as hazardous waste by 40 CFR part 261, Subparts C and D (implementing the Federal Resource Conservation and Recovery Act) or by any other state or local hazardous waste classification program. Should Laboratory tests find this product not in compliance with 40 CFR part 261 customer agrees to pay all disposal costs incurred.

Notes:
-- = Not analyzed
CAS = Chemical Abstracts Service
FD = field duplicate sample
J = Estimated value less than reporting limit but greater than method detection limit or value is estimated due to a sampling or laboratory quality control issue
mg/kg = milligram(s) per kilogram
N = normal sample
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit
UJ = The analyte was below the reported sample quantitation limit; however, the reported value is approximate

Bold indicates the analyte was detected
Shading indicates the result exceeded screening criteria

Notes:
-- = Not analyzed
CAS = Chemical Abstracts Service
FD = field duplicate sample
J = Estimated value less than reporting limit but greater than method detection limit or value is estimated due to a sampling or laboratory quality control issue
mg/kg = milligram(s) per kilogram
N = normal sample
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit
UJ = The analyte was below the reported sample quantitation limit; however, the reported value is approximate

Bold indicates the analyte was detected
Shading indicates the result exceeded screening criteria

Pyridine	110-86-1	µg/L	5.9	--	1 U	1.1 U

Notes:
-- = Not analyzed
CAS = Chemical Abstracts Service
FD = field duplicate sample
J = Estimated value less than reporting limit but greater than method detection limit or value is estimated due to a sampling or laboratory quality control issue
µg/L = microgram(s) per liter
N = normal sample
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit
UJ = The analyte was below the reported sample quantitation limit; however, the reported value is approximate

Bold indicates the analyte was detected
Shading indicates the result exceeded screening criteria

Notes:
-- = Not analyzed
CAS = Chemical Abstracts Service
FD = field duplicate sample
J = Estimated value less than reporting limit but greater than method detection limit or value is estimated due to a sampling or laboratory quality control issue
mg/kg = milligram(s) per kilogram
N = normal sample
U = The analyte was analyzed for, but was not detected above the reported sample quantitation limit
UJ = The analyte was below the reported sample quantitation limit; however, the reported value is approximate

Bold indicates the analyte was detected
Shading indicates the result exceeded screening criteria
