Notes:

[a] Screening Levels - No Effect ESLs are based on no observed adverse effect levels (NOAELs) and are the most conservative among plants, invertebrates, birds, and mammals. Low Effect ESLs are based on lowest observed adverse effect levels (LOAELs) for birds and mammals.

[b] Site-specific ecological preliminary remedial goals (EcoPRGs) are risk-based concentrations calculated for receptors that would potentially be found in the area around the Klamath project sites. The bird and mammal EcoPRGs selected for use in the risk estimates are the most conservative of the risk-based values calculated for birds and mammals from the major feeding guilds (herbivores, invertevores, and carnivores) using LOAEL toxicity values and an AUF=1 (100% site use). Supporting information and calculation of EcoPRGs is presented in Appendix G, Table G-2 through Table G-7.

[c] Area use factors for the hermit thrush and vagrant shrew were selected for use in the risk estimates as these two receptors had the most conservative risk-based concentrations. The AUF is calculated from the receptors home range versus the size of the REC. Supporting information and calculation of AUFs is presented in Appendix G, Table G-7.

-- = not available or not applicable
<1 = less than 1
>1 = greater than 1
AUF = area use factor
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient - all values presented to 1 significant figure
ND = not detected
Step 1 = analyte was eliminated in Step 1 of the ecological risk evaluation. No Effect screening HQ was less than 1.
Step 2 = analyte was retained after Step 1 (the screening HQ >1), but was eliminated in Step 2 (the refined HQ <1).

Table G-16. Ecological Risk Estimates - Iron Gate Shooting Range

Notes:

[a] Screening Levels - No Effect ESLs are based on no observed adverse effect levels (NOAELs) and are the most conservative among plants, invertebrates, birds, and mammals. Low Effect ESLs are based on lowest observed adverse effect levels (LOAELs) for birds and mammals.

[b] Site-specific ecological preliminary remedial goals (EcoPRGs) are risk-based concentrations calculated for receptors that would potentially be found in the area around the Klamath project sites. The bird and mammal EcoPRGs selected for use in the risk estimates are the most conservative of the risk-based values calculated for birds and mammals from the major feeding guilds (herbivores, invertevores, and carnivores) using LOAEL toxicity values and an AUF=1 (100% site use). Supporting information and calculation of EcoPRGs is presented in Appendix G, Table G-2 through Table G-7.

[c] Area use factors for the hermit thrush and vagrant shrew were selected for use in the risk estimates as these two receptors had the most conservative risk-based concentrations. The AUF is calculated from the receptors home range vs the size of the REC. Supporting information and calculation of AUFs is presented in Appendix G, Table G-7.

-- = not available or not applicable
<1 = less than 1
>1 = greater than 1
AUF = area use factor
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient - all values presented to 1 significant figure
ND = not detected
Step 1 = analyte was eliminated in Step 1 of the ecological risk evaluation. No Effect screening HQ was less than 1.
Step 2 = analyte was retained after Step 1 (the screening HQ >1), but was eliminated in Step 2 (the refined HQ <1).

Table G-17. Ecological Risk Estimates - Iron Gate Fish Hatchery Burn Pit

Notes:

[a] Screening Levels - No Effect ESLs are based on no observed adverse effect levels (NOAELs) and are the most conservative among plants, invertebrates, birds, and mammals. Low Effect ESLs are based on lowest observed adverse effect levels (LOAELs) for birds and mammals.

[b] Site-specific ecological preliminary remedial goals (EcoPRGs) are risk-based concentrations calculated for receptors that would potentially be found in the area around the Klamath project sites. The bird and mammal EcoPRGs selected for use in the risk estimates are the most conservative of the risk-based values calculated for birds and mammals from the major feeding guilds (herbivores, invertevores, and carnivores) using LOAEL toxicity values and an AUF=1 (100% site use). Supporting information and calculation of EcoPRGs is presented in Appendix G, Table G-2 through Table G-7.

[c] Area use factors for the hermit thrush and vagrant shrew were selected for use in the risk estimates as these two receptors had the most conservative risk-based concentrations. The AUF is calculated from the receptors home range versus the size of the REC. Supporting information and calculation of AUFs is presented in Appendix G, Table G-7.

-- = not available or not applicable
<1 = less than 1
>1 = greater than 1
AUF = area use factor
EcoPRG = ecological preliminary remedial goal
ESL = ecological screening level
HQ = hazard quotient - all values presented to 1 significant figure
ND = not detected
Step 1 = analyte was eliminated in Step 1 of the ecological risk evaluation. No Effect screening HQ was less than 1.
Step 2 = analyte was retained after Step 1 (the screening HQ>1), but was eliminated in Step 2 (the refined HQ <1).

Dynamite Cave Technical Memorandum

Jacobs

Memorandum

2020 SW Fourth Avenue, Suite 300
Portland, Oregon 97201
United States
T +1.503.235.5000

www.jacobs.com

Subject	**Copco No. 1 Dynamite Cave Inspection Report**
Project Name	Lower Klamath Hydroelectric Project (FERC No. P-14803)
Attention	Demian Ebert, PacifiCorp
From	David Poley, Jacobs
Date	May 5, 2022
Copies to	Emilio Candanoza, Jacobs

1. Introduction

This technical memorandum documents the field observations and activities performed within the Copco No. 1 Dynamite Cave (cave) (Figure 1 in Attachment 1) by Jacobs on behalf of PacifiCorp for the Lower Klamath Hydroelectric Project (FERC No. P-14803). All fieldwork was performed according to Section 3.4 ("Copco No. 1 Dynamite Cave") of the *California Site Investigation Work Plan* (Jacobs 2021).

Until March 2, 2022, the cave had not been accessed for many years. During a Phase I Environmental Site Assessment of the cave (AECOM 2018), PacifiCorp noted that any dynamite had likely been removed from the cave. However, because AECOM could not confirm an absence of explosives or explosive residue within the cave, the cave was included as a recognized environmental condition to be addressed under Exhibit C of a Property Transfer Agreement between PacifiCorp and the Klamath River Renewal Corporation.

2. Field Observations and Activities

On March 2, 2022, a scaffold was erected to allow for safe entry to the cave and removal of the wooden panels blocking the cave entrance. The cave was allowed to vent overnight and was accessed and inspected the following day by a qualified unexploded ordinance (UXO) technician. The following was determined:

- Air monitoring of the cave was performed using a calibrated MultiRae air quality monitor prior to entry and while inside the cave (Photographs 1 and 2 in Attachment 2). Air monitoring indicated no safety hazards within the breathing zone (20.9 percent oxygen, 0 percent lower explosive limit, and 0 parts per million carbon monoxide).
- The cave entryway is 4 feet wide (Photographs 3 and 4 in Attachment 2). The inside of the cave is 4 to 4.5 feet wide from front to back, but a portion of the cave is 3.5 feet wide near the center. The maximum height of the cave is 5 feet above a plywood floor (Figure 2 in Attachment 1; Photographs 5 and 6 in Attachment 2) that lies 8 to 9 inches above the cave's floor and extends from the entryway to the back of the cave. The plywood floor is approximately 9 feet long by 4 feet wide and is cantilevered over the cave shaft in the rear of the cave. The plywood floor is supported by 4-inch by 4-foot wood posts and 2- by 4-inch wood beams (Photograph 7 in Attachment 2).

- The depth of the cave from front to back is approximately 9 feet. The floor of the cave ends 6 feet from the cave's entryway and becomes a shaft. The bottom of the 3- by 4- by 22.5-foot-deep shaft at the back of the cave contains wood and debris.
- A qualified, Jacobs UXO technician performed a survey of the cave for dynamite and explosives residue, and neither was observed in the cave or at the bottom of the shaft. The cave's walls showed evidence of former blasting with dynamite (Photograph 8 in Attachment 2).
- The presence or absence of residual explosives was determined by collecting swipe samples from representative locations on the floor, ceiling, and sidewalls of the cave and spraying each with Expray #1 for Group A explosives, Expray #2 for Group B explosives, and Expray #3 for improvised explosives with nitrate (https://idealblasting.com/expray-explosives-detection-field-test-kit/). Swipe samples were collected from six locations on the cave's floor, three locations on the cave's ceiling, and three locations on each sidewall. All swipe sample locations tested negative for the presence of residual explosives. Figure 2 (Attachment 1) depicts the general sample locations.

On March 9, 2022, the scaffold was inspected, and air monitoring was performed prior to entering the cave to perform a video survey of the shaft. The video survey confirmed an absence of explosives and the presence of charred lumber, detritus, a metal rod, and some painted wood at the base of the shaft (Photographs 9 and 10 in Attachment 2). The cave entryway was subsequently secured by PacifiCorp, and the scaffold was dismantled and removed.

3. Conclusions

Based on visual observations and Expray testing completed within the cave, explosives and explosive residuals were confirmed to be absent from the cave.

Appendix I
Consolidated Comment Matrix

COMMENT MATRIX for the Stakeholder Review Draft Dated October 2022
Lower Klamath Hydroelectric Project Site Investigation Reports for California and Oregon
FERC No. P-14803
March 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
California Department of Fish and Wildlife - Office of Spill Prevention and Response/California Department of Water Resources (Comments on the California Site Investigation Report)					
CA-General-1	KT	General Comment		[This comment #1 may be withdrawn. CDFW is double checking and will be in touch] CDFW-OSPR is concerned that the lack of screening data for lead shot and target fragments (a potential source of PAHs) is a data gap that PacifiCorp needs to address. The deleterious effects of wildlife ingestion of lead shot or bullet fragments have been well documented over many years and in numerous scientific studies (Rattner et al. 2008). CDFW-OSPR considers lead shot as a poison under California Fish and Game Code section 3005. Additional clarification emailed by Kevin Takei (California) to Demian Ebert (PacifiCorp) on January 11, 2023, at 9:01 AM: "CDFW is fine withdrawing the comment because we understand KRRC will be disposing dam debris on top of the shooting range. As a result the likelihood of wildlife ingesting lead shot/bullet fragments will be low. If KRRC changes its plans and ends up not disposing debris on the shooting range, CDFW would like to reopen this comment."	Acknowledged. No changes necessary.
CA-General-2	KT	General Comment		For sites recommended for removal actions, CDFW is not commenting on the recommendations. CDFW anticipates providing input on specific actions during preparation of the removal action plans.	Acknowledged. No changes necessary.
CA-1	KT		Page 3-11, Section 3.3.4.1 Derivation of Site-Specific EcoPRGs	The method used to calculate ecological preliminary remedial goal in soil is acceptable, as are the bioaccumulation factors used (Appendix G, Tables G-5).	Acknowledged. No changes necessary.
CA-2	KT		Page 5-1, Section 5.1	Was trash and other debris removed or does it remain?	Debris and trash have not been removed, but will be before PacifiCorp stops operating the Lower Klamath Project. No changes necessary.
CA-3	KT		Page 6-9, Section 6.7 Recommended Actions	May need to coordinate implementation of the remedial action plan with any restoration activity by RES.	PacifiCorp expects that the removal action plan would be coordinated with the KRRC's team to identify waste staging areas, stockpile management, soil reuse, backfill and compaction, and offsite disposal requirements all with an eye toward reducing potential conflicts and schedule impacts on dam removal and restoration activities. No changes necessary.
CA-4	KT		Appendix D: Analytical Laboratory Results	CDFW-OSPR requests PacifiCorp ensure that the laboratory, Eurofins/TA is a California state-certified analytical laboratory. CDFW-OSPR requests the PacifiCorp include a current certification document as an appendix to the Draft Final document.	Eurofins/TA has provided their certification in the California Environmental Laboratory Accreditation Program and that document has been added to Appendix D. Note that the certificate expired on 7/7/2022. Eurofins/TA has applied for a renewal, which is in progress, and all samples were analyzed prior to that date.

COMMENT MATRIX for the Stakeholder Review Draft Dated October 2022
Lower Klamath Hydroelectric Project Site Investigation Reports for California and Oregon
FERC No. P-14803
March 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
CA-5	KT		Appendix E, Data Quality Evaluation Report	CDFW-OSPR has concerns regarding the substituted phenol data. The surrogate QC indicates that samples may have been mishandled during extraction yielding results that are biased low. Please to include a current certification document as an appendix to the Draft Final document to estimate the impact. Additional clarification emailed by Kevin Takei (California) to Demian Ebert (PacifiCorp) on January 23, 2023, at 3:36 PM: "This was an observation of a trend in one batch of semi-volatiles that the substituted-phenol surrogates were reported with low recoveries; the corresponding quality control samples also were reported with low substituted-phenol recoveries. Aggressive extract concentration is suspected to affect substituted-phenol surrogate recoveries and by association, substituted phenol compounds in samples. The data was appropriately flagged by the validators. No certification is needed."	Acknowledged. No changes necessary.
CA-6	KT		Appendix E, Data Quality Evaluation Report	Please clarify how the validators used data flagged as "J" or "UJ" to identify the maximum concentration detected or if the data was ignored. Additional clarification emailed by Kevin Takei (California) to Demian Ebert (PacifiCorp) on January 23, 2023, at 3:36 PM: "My question is regarding how the validators calculated the maximum possible concentrated for compounds where the compound is flagged "UJ." If recoveries for a compound was low, was the maximum possible concentration calculated based on the reporting limit, or a recovery-corrected result?"	For Section 3.11, the laboratory originally reported the analytical data for various dioxin/furan congeners as "estimated maximum possible concentrations" that were considered detectable by the laboratory and flagged with a "J" (estimated). However, during data validation by Jacobs, it was determined that the ion ratio criteria were exceeded for these congeners. Consequently, the data validator changed the final flag to "UJ" (estimated non-detect). The original estimated result values were not changed and no additional calculations or adjustments were made. No changes necessary.
CA-7	KT		Appendix E, Data Quality Evaluation Report	The Data Quality Evaluation Report is missing the required signatures of the Project Manager/Senior Chemist, who validated the data.	Signature of Mark Fessler/Senior Chemist has been provided in the final report.
CA-8	KT			Appendix G, Table G-6. It is not clear how the HQ was calculated when the incidental soil ingestion rate for the Red-tailed Hawk of 2.4% was used. Based on the 90th percentile from a Monte Carlo simulation, a 5.2% soil ingestion rate (as proportion of diet) is used for the Red-tailed Hawk in the USEPA Eco-SSLs (https://www.epa.gov/risk/ecological-soil-screening-level-eco-ssl-guidance-and-documents).	The percentage of soil ingestion for the red-tailed hawk used in the analysis is the 50th percentile as shown on Table 3 of the EcoSSL guidance. The 90th percentile is applicable for the calculation of the EcoSSLs, which are the most conservative values used for screening purposes. Remedial actions and calculation of preliminary remedial goals (EcoPRGs) are typically based on more realistic exposure and toxicity assumptions, i.e., lowest observed adverse effect levels and median (i.e., 50th percentile) uptake rates. It should be noted that the EcoPRGs remain conservative in that the fraction of soil ingestion is added onto the food ingestion rate rather than considered part of the total food ingestion rate (i.e., 100% food plus additional 2.4% soil = 102.4% total intake). No changes necessary.

CA-9	KT			*Appendix G, Table G-9 through Table-18*. There is no mention of the calculation of hazard indices for chemicals with a similar mechanism of action. Please address the cumulative risk potential for all receptors based on co-exposure to COPECs with similar chemical structures or modes of toxicity. CDFW OSPR recommends the following: i. Hazard indices (HIs) be calculated for chemicals with a common mechanism of action or common target organs [examples of chemical groups would be: polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds, semivolatile organic compounds, total petroleum hydrocarbons]. ii. Chemicals do not exit the screening-level ERA even if the HQ for that particular chemical is less than one unless the HI for that group of chemicals is less than one. Following DTSC guidance (DTSC HERO 1996) will ensure that chemicals are not eliminated inadvertently when the incremental summing of effects adds up to HI greater than 1.	As the comment notes, hazard indices (HIs) are typically computed for chemicals within groups with similar toxic action; however, these are generally limited to PAHs, PCBs, and organochlorine pesticides. Summing of volatiles and petroleum products has not been conducted for this project because it is not recommended by DTSC guidance and is not standard practice. It should be noted that DTSC guidance (1996) provides a general framework and set of approaches to use when evaluating potential risks. It does not constitute a rigid system of points of departure. Sample-specific HIs for low molecular weight PAHs, high molecular weight PAHs, and aroclors have been added to Appendix G for all sites with detected analytes in these groups. Since EcoPRGs were not derived for all PAHs or aroclors, the HIs are computed using the EcoPRG (if available) or the Low Effect ESL. HIs were computed both with and without application of AUFs. This information has been included in the ecological risk assessment section for each site and the weight of evidence discussion where applicable.
CA-10	JD	General Comment		I do not have any comments or questions regarding this report. Thank you for conducting a very thorough assessment.	Acknowledged. No changes necessary.
CA-11	KG	General Comment		I also did not have any comments or questions. Thanks!	Acknowledged. No changes necessary.

Klamath River Renewal Corporation (Comments on the California and Oregon Site Investigation Reports)					
KRRC-1	LL	General Comment on Both Reports		KRRC endorses the comments submitted by California and Oregon, including but not limited to CDFW General Comment No. 2: "For sites recommended for removal actions, CDFW is not commenting on the recommendations. CDFW anticipates providing input on specific actions during preparation of the removal action plans."	Acknowledged. No changes necessary.
KRRC-2	LL	Both Reports	Section 1.2 last paragraph	We note that the characterization of the Memorandum of Resolution in the last paragraph of Section 1.2 of each report is not quite accurate – the MOR doesn't establish a process; it marks the completion of the process. I suggest rewording it as follows: "Site closure refers to a site closure agreed upon by PacifiCorp, KRRC, and the State of [California/Oregon] in a Memorandum of Resolution."	The final paragraph in Section 1.2 has been edited: "Recommended next steps will be provided for each REC based on the results of the risk evaluation. Next steps may consist of a request for REC closure, collection of additional environmental samples, or site remediation (Figure 1-5). If risk evaluation of the analytical results indicates acceptable risk, PacifiCorp will request closure of the REC. As used in this report, site closure refers to a closure action agreed upon by PacifiCorp, KRRC, and California and documented in a Memorandum of Resolution. If analytical results of COPCs indicate the risk is unacceptable, PacifiCorp will either propose advancement of step-out borings to collect additional samples according to the sampling plan established for the REC or develop a remediation plan based on the field and analytical data already collected." The corresponding edit is made in the Oregon Site Investigation Report.

Oregon Department of Justice (Comment on the Oregon Site Investigation Report)					
OR-1	CM	General Comment		Oregon does not have any specific comment, but we do want to make a general inquiry about upcoming site work and PAC/Jacobs awareness and protocols around cultural resources. Work on the Oregon site may need to be cognizant of such matters and a plan needs to be in place. Please advise.	PacifiCorp is fully aware of the cultural resources potentially present at the various sites. All the sites have been reviewed by specialists and some have been cleared for work because there are no resources present. Others are in proximity to known sites and will require a monitor to be present during work. None of the sites are within known cultural resource sites. Cultural monitors were present during sampling as necessary and will be present during any clean-up work. All contractors also operate in compliance with PacifiCorp's inadvertent discovery plan. No change necessary.

1. Introduction

PacifiCorp retained Jacobs Engineering Group Inc. (Jacobs) to prepare this *Soil Removal Action Plan for Oregon* (Oregon RAP) for the Lower Klamath Hydroelectric Project (Project). The purpose of the Oregon RAP is to document how soil removal activities will be performed at the one recognized environmental condition (REC) located in Oregon – the J.C. Boyle Dispersed Recreation Area – 2.

The J.C. Boyle Dispersed Recreation Area – 2 REC (the term "site" is used interchangeably with REC in this plan) was originally identified during Phase I environmental site assessments conducted by AECOM Technical Services, Inc. (AECOM) on behalf of the Klamath River Renewal Corporation (KRRC) and was subsequently identified in Exhibit C of a Property Transfer Agreement (Agreement) between PacifiCorp, KRRC, and the States of California and Oregon. PacifiCorp assessed the site under the *Oregon Site Investigation Work Plan* (Oregon SIWP) (Jacobs 2021a) to confirm the presence or absence of constituents of potential concern (COPCs).

This Oregon RAP will additionally be utilized should any sites addressed under the *Oregon Site Investigation Work Plan Supplement No. 1* (Jacobs 2023a) require a soil removal action.

PacifiCorp intends that approval of this Oregon RAP will constitute endorsement of the plan from KRRC and the State of Oregon. Following implementation of the RAP and completion of documentation affirming that the cleanup goals defined in this RAP have been met, the RECs will be ready for closure. As used in this Oregon RAP, site closure refers to a closure action agreed upon by PacifiCorp, KRRC, and California and documented in a Memorandum of Resolution.

1.1 Background

The Oregon SIWP provides detailed background information on the J.C. Boyle Development, further defines the Exhibit C RECs, and contains a discussion of the surrounding lands, local geology, and historical practices (Jacobs 2021a). The Oregon SIWP was approved by KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021). A separate *California Site Investigation Work Plan* (California SIWP) was developed for the Copco No. 1, Copco No. 2, and Iron Gate Dam developments and their associated RECs (Jacobs 2021b). The California SIWP was approved by KRRC (Lowy, pers. comm. 2021) and the State of California.

The findings of the various site assessments were documented in the *Oregon Site Investigation Report* (Oregon SI Report) (Jacobs 2023b), in the *California Site Investigation Report* (Jacobs 2023c), and in accordance with Section 4 of each SIWP. A separate *Soil Removal Action Plan for California* was prepared for the various California RECs (Jacobs 2023d). The Oregon SI Report recommended soil removal actions for the J.C. Boyle Dispersed Recreation Area – 2. The *California Site Investigation Report* recommended either soil removal actions or closure for the Exhibit C RECs in California. The recommendations for the California RECs were based on the results of the site investigations and subsequent evaluation of the analytical data.

1.2 Removal Action Plan Objectives

The primary objectives of this Oregon RAP are as follows:

- Identify the general field activities that will be performed in support of the soil removal action.
- Identify the site-specific field activities that will be performed in support of the soil removal action.

- Identify the confirmation soil sampling requirements upon removal of the initial soil volume recommended in the Oregon SI Report.
- Identify the remedial action objectives and define the process that will be used to demonstrate the remedial action objectives have been met.

1.3 Investigative Standard and Future Site Uses

The initial contaminants of potential concern (COPCs) for the site were determined based on the Investigative Standard, as defined in Section 1.5 of the Oregon SIWP (Jacobs 2021a), on expectations of COPCs for a burn pit. All fieldwork and data evaluations were additionally carried out in accordance with the Investigative Standard. The COPCs, intended future site uses, and exposure pathways for the site were approved by KRRC and the State of Oregon. The exposure pathways were used to determine the screening levels developed in Section 3.3 of the Oregon SIWP and to evaluate the analytical results in Section 4 of the Oregon SI Report (Jacobs 2023b). The associated information in these documents is incorporated into this Oregon RAP by reference.

The constituent of concern (COC) for the site is lead. The COC was established in the Oregon SI Report and is the basis for the soil removal action and confirmation sampling described under this Oregon RAP. The COC was determined based on 1) the future site use (passive recreation/natural habitat); 2) utilization of the Investigative Standard when investigating the site under the Oregon SIWP and evaluating the analytical data under the Oregon SI Report, and 3) the results of the risk assessments (human health, leaching to groundwater, and ecological) that were performed in the Oregon SI Report (summarized in Section 2 of this Oregon RAP).

When working under this Oregon RAP, confirmation soil samples will be collected in accordance with the Investigative Standard presented in the Oregon SIWP and SI Report.

1.4 Report Organization

This Oregon RAP contains the following sections and appendix:

- **Section 1 – Introduction**: States the purpose of the Oregon RAP, provides background information on the evolution of the REC and determination of the COC for the site, specifies the Oregon RAP objectives, and describes the investigative standards and future site use.
- **Section 2 – Risk Assessment Summary and Cleanup Goals**: Describes the risk assessment approach and summarizes cleanup goals.
- **Section 3 – Implementation Plan**: Provides a general overview of how the soil removal action will be conducted.
- **Section 4 – J.C. Boyle Dispersed Recreation Area – 2**: Summarizes the background and site-specific removal action for the site.
- **Section 5 – References**: Provides a bibliographic listing of documents cited in this Oregon RAP.
- **Appendix – Consolidated Comment Matrix**: Contains consolidated review comments and responses from KRRC, California, and Oregon related to this Oregon RAP.

2. Risk Assessment Summary and Cleanup Goals

This section summarizes the risk assessment conducted in 2022 (Jacobs 2023b) and the cleanup goals derived from the risk assessment results.

2.1 Risk Assessment Summary

This section describes the general risk assessment approach used to evaluate human health risk, leaching to groundwater, and ecological risk from COPCs in soil and groundwater at J.C. Boyle Dispersed Recreation Area – 2. Risk managers used the results of this analysis to support risk management decisions at the site. The detailed risk assessment approach and results are described in further detail in the Oregon SI Report (Jacobs 2023b).

2.1.1 Human Health Risk Assessment

A streamlined human health risk assessment (HHRA) was conducted to evaluate human health risk to applicable receptors from exposure to contaminants in soil and groundwater. The HHRA provides information that can support risk-management decision making, including the need for further action.

A screening-level HHRA was conducted for the J.C. Boyle Dispersed Recreation Area – 2 by comparing COPC concentrations in soil and shallow groundwater to the Oregon Department of Environmental Quality (ODEQ) *Risk-Based Concentrations for Individual Chemicals in Soil* (ODEQ 2018).

The risk evaluation approach is based on Oregon environmental cleanup regulations, which require a risk-based approach for assessing and managing environmental contamination from releases of hazardous substances under the state's hazardous substance remedial action rules (Oregon Administrative Rules 340-122-0100 through 340-122-0115). The risk evaluation was conducted in accordance with *Risk-Based Decision Making for the Remediation of Contaminated Sites* (ODEQ 2017).The HHRA framework consists of the following four basic steps (EPA 1989):

1) Data Evaluation: The first step consists of reviewing and evaluating available data, identifying COPCs in media at each site.
2) Exposure Assessment: The second step involves evaluating potential exposure pathways for COPCs and the potential human populations that could be exposed to them, either now or in the future. In this step, exposure point concentrations (EPCs) are estimated from measured or modeled concentrations, and pathway-specific exposure parameters and assumptions are evaluated.
3) Toxicity Assessment: The third step comprises compiling toxicity values that characterize potential adverse health effects from exposure to COPCs and that are used to estimate potential risks to human health.
4) Risk Characterization**:** The fourth step combines the results of the previous three steps to quantitatively characterize potential risks to human health associated with exposure to COPCs at J.C. Boyle Dispersed Recreation Area – 2. Potential cancer risk and adverse noncancer health effects are estimated. Uncertainties in risk characterization are discussed.

2.1.2 Ecological Risk Assessment

A streamlined ecological risk assessment (ERA) was completed for each site to evaluate potential risks to ecological receptors from contaminants in soils under current and potential future land use conditions.

The results of the streamlined ERA were used in conjunction with the HHRA and leaching to groundwater evaluation to provide risk managers with information needed to support risk management decisions.

The streamlined ERAs were performed in general accordance with U.S. Environmental Protection Agency (EPA) and ODEQ guidance as follows:

- *The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (EPA 2001)
- *Guidelines for Ecological Risk Assessment* (EPA 1998)
- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (EPA 1997)
- *Conducting Ecological Risk Assessments* (ODEQ 2020)

The streamlined ERAs were conducted in a phased approach as follows:

- Step 1 – Screening Evaluation: The screening evaluation consists of a very conservative (i.e., protective of the most sensitive ecological receptors) screen of sample-specific detected results for the site compared to available background threshold values and the No Effect Ecological Screening Level (No Effect ESL). Chemicals with observed concentrations that do not exceed the No Effect ESLs were considered to not pose a potential risk to ecological receptors and are eliminated from further evaluation. Chemicals with detected concentrations exceeding the No Effect ESLs were carried forward to Step 2 (Refined Evaluation).
- Step 2 – Refined Evaluation: The refined evaluation consists of a comparison of sample-specific results against a refined screening level that is based on a lowest observed adverse effect level for wildlife. The chemicals with observed concentrations that do not exceed the Low Effect ESL were considered to not pose a significant risk to ecological receptors. Chemicals with detections exceeding the Low Effect ESL for soil were carried forward to Step 3 (Site-Specific Evaluation). Chemical with detections exceeding the Low Effect ESLs for groundwater exposures were carried forward to Step 4 (Weight of Evidence Evaluation).
- Step 3 – Site-Specific Evaluation: The site-specific evaluation consists of a comparison of sample-specific detected results against site-specific ecological preliminary remedial goals (EcoPRGs) for soil that were developed for avian and mammalian receptors that may potentially be found at the site. Chemicals with observed concentrations exceeding the EcoPRGs were carried forward to Step 4 (Weight of Evidence Evaluation).
- Step 4 – Weight of Evidence Evaluation: The weight of evidence evaluates multiple lines of qualitative and quantitative evidence to place the potential risks into context of site-specific conditions. These lines of evidence include the results from Steps 1 through 3, comparisons to regional background concentrations, potential for ecological receptors to use the site, available habitat, and expected future use of the site. The results of the weight of evidence evaluation are used to inform risk managers of chemicals considered to pose a potential risk to ecological receptors so that remedial decisions can be made for the site.

The streamlined ERA was conducted under the following assumptions and constraints. These are typical for ERAs performed for both public and private entities:

- Evaluation of current exposures is derived from existing conditions.
- The abiotic medium of primary ecological concern is soil. Groundwater is considered a minor medium of potential concern, but it is evaluated as it may be encountered within 4 feet of ground surface.
- Measured chemical concentrations are assumed to be at steady-state levels.

- Chemicals never detected or not analyzed for in soil samples are not evaluated.
- Each chemical measured in collected samples is considered to have similar bioavailability as the chemical form used in the toxicity studies that are used to estimate potential for risk.
- Toxicological information used represents information currently available from literature and database searches.

2.2 Cleanup Goals

As described above and in the Oregon SI Report (Jacobs 2023b), results of the HHRA and environmental site assessments were used to make risk management decisions. Because the risk at J.C. Boyle Dispersed Recreation Area – 2 was determined to be unacceptable, PacifiCorp has chosen to remove the impacted soil (Figure 2-1).

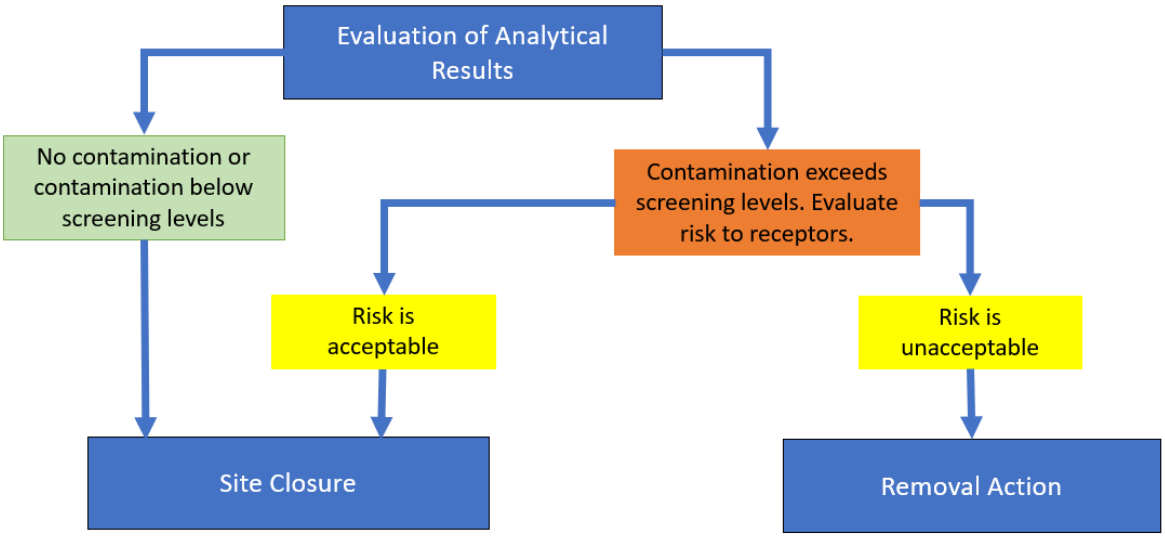

Figure 2-1. Flowchart of Possible Next Steps

Lead is the only COC retained from the risk assessment. The cleanup goal for lead is 34 milligrams per kilogram (mg/kg), based on the protection of groundwater from soil leaching. Subsequent sections of this Oregon RAP describe the approach to ensure the removal action objectives are met for the site.

3. Implementation Plan

This section presents the general plan for addressing impacted shallow soil at the site. Site-specific removal activities are detailed in Section 4.

3.1 Removal Action Work Plan

This subsection outlines the typical administrative controls, permit requirements, and sequence of work for soil removal (i.e., excavation) activities at the site.

3.1.1 Site Security and Access

During all removal activities, access will be restricted to authorized personnel only. Contractors will follow the site access and sign-in procedures established by KRRC or their representative.

3.1.2 Traffic Control

As necessary, traffic management will be implemented to manage the safe entry and exit of vehicles from the site. Equipment and personnel will be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas. Upland routes covered with pavement, bare ground, or non-native vegetation will be utilized as access routes to and from the excavation sites to the maximum extent practicable.

3.1.3 Cultural Resources

Cultural resources are known to exist in the vicinity of the three dam developments and surrounding lands. As part of the original site investigations and prior to any field activities, AECOM conducted a review of potential effects on historic and archaeological resources at each proposed sampling site (AECOM 2022a, 2022b). The goal was to ensure that soil sampling and cleanup activities do not adversely affect National Register of Historic Places-eligible archaeological or historic resources. The AECOM review recommended that archaeological monitoring be provided during soil sampling at one site in Oregon (J.C. Boyle Dispersed Recreation Area – 2). Archaeological monitoring was performed by Jacobs when implementing the Oregon SIWP at this site. Therefore, archaeological monitoring will again be performed by Jacobs when implementing this Oregon RAP at the J.C. Boyle Dispersed Recreation Area – 2). Should cultural monitoring result in the inadvertent discovery of culturally sensitive resources, the Jacobs team will notify the KRRC's cultural resources team.

3.1.4 Biological Resources

The following biological avoidance, minimization, and mitigation measures will be implemented for the protection of special-status species that may be present on or near the site during field activities:

- A preconstruction biological assessment will be completed by a qualified biologist to review potential effects on biological resources before removing debris and implementing the soil removal actions at each site. This will include removal areas, staging and laydown areas, and undeveloped access routes.
- All field team members, including the removal contractor and lower-tier subcontractors, will complete the online KRRC Biological Resource Training program as part of premobilization activities.
- A preconstruction nesting survey will be completed by a qualified biologist for sites with remedial activities planned to occur during the nesting season (February 1 – August 31). If nesting birds are found during surveys, the Oregon Department of Fish and Wildlife (ODFW) will be notified, and no Project activity will occur within 250 feet for raptors and 100 feet for other nonlisted birds until a site-

specific mitigation and monitoring plan has been developed (including reporting requirements) and agreed upon with ODFW.

3.1.5 Permit Requirements

Necessary permits and notifications for removal activities, transportation, stormwater control, and air quality (including notifications to Klamath County, if needed) will be obtained prior to the start of removal activities. Copies of the permits will be onsite and will be made available for inspection during working hours. The anticipated permits will include, at a minimum:

- Klamath County will review this Oregon RAP and approve, as necessary, for the execution of the work.
- Dust control management measures will be implemented. Section 3.1.13 provides additional information regarding compliance with these rules.

3.1.6 Mobilization and Site Preparation

Mobilization activities will include the delivery and setup of equipment, materials, and tools required to perform the soil removal actions at the various sites. Resources necessary to excavate soil and perform soil removal activities will be mobilized; these resources include personnel and all subcontractors, equipment, materials, supplies, and support facilities. The support facilities will include a secure material and equipment storage area and any other facilities needed to support work activities.

Site preparation activities will include: 1) establishing work zones; 2) implementing stormwater best management practices (BMPs); 3) defining baseline topography and excavation areas by a licensed surveyor; and 4) clearing and grubbing of surface vegetation in the defined excavation area.

Underground Service Alert will be notified at least 48 hours before field activities commence to mark subsurface utilities within and surrounding the planned work areas. A third-party utility locator service provider will also be utilized to identify utilities within and surrounding the planned work area. Field maps showing the results of the utility survey will be completed in the field. If any utilities are identified during the survey, they will be identified on the ground by spray painting along the utility centerline. The field markings will be color-coded to identify the type of utility according to the American Public Works Association uniform color code.

Topographical surveying was not completed at the site. As part of site preparation activities, a topographical base map will be developed for the excavation. The base map will be developed by a surveyor licensed in the State of Oregon. The baseline survey will be used in conjunction with progress and as-built surveys to determine the volume of soil removed from the excavation site.

Jacobs, in consultation with PacifiCorp and KRRC, will also designate an area for establishing a secure central storage and equipment laydown yard. If needed, additional temporary laydown or stockpile areas will be identified for each site. The storage and laydown areas will be secured with temporary fencing.

Project mobilization will additionally include:

- Confirming that all applicable and necessary permits have been secured (Section 3.1.5).
- Setting up temporary facilities and utilities, such as portable toilets and hand and eye washing stations.
- Identifying and clearly demarcating work zones, including the exclusion, decontamination, and support zones, at each site. The exclusion zone will include all areas of excavation, contaminated soil staging areas, and the truck loading area. The decontamination zone will be used for decontaminating

personnel, equipment, and vehicles prior to exiting the site. The support zone will be used to temporarily store equipment, vehicles, and clean soil and to accommodate Project personnel.

- Identifying and clearly marking contaminated soil staging areas, if needed.
- Preparing the decontamination area in a designated area approved by the construction manager.
- Establishing traffic routes from the work zones to the decontamination areas to minimize the spread of potentially impacted soils.
- Positioning all health and safety equipment and supplies for use, if needed.

3.1.7 Equipment

The excavation contractor will determine the equipment needed on a case-by-case basis for each site. The required equipment will depend on actual site conditions and access needs. A list of possible equipment is as follows:

- Front end loaders
- Bulldozers
- Hydraulic excavators (i.e., backhoes)
- Water truck
- Dump trucks
- Temporary fencing
- Other equipment, based on field needs

Equipment and personnel will be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas.

3.1.8 General Excavation Procedure

The site-specific initial excavation volume (approximately 180 cubic yards) has been estimated based on the data collected in the Oregon SI Report. Excavation will be conducted in the following general sequence:

1) Staging and access paths will be developed for equipment to be used during the soil removal process. Roads will be maintained, and tire decontamination will be implemented to prevent offsite tracking.
2) Underground utility clearances will be conducted through the use of the local one call service and a private utility location contractor, as necessary.
3) The construction manager will identify appropriate locations for fugitive dust monitoring and arrange for monitoring that complies with health and safety requirements.
4) Excavation offset stakes will be used to mark the planned limits of excavation.
5) Designated areas will be excavated to a predetermined depth.
6) Excavated soil will primarily be loaded directly into haul trucks. At the contractor's option, soil may be stockpiled at a designated stockpile location (Section 3.1.6).
7) Excavation operations will be managed following the BMPs described in the Project-specific Stormwater Management Plan.
8) To prevent unauthorized access, a temporary 6-foot-high fence will be installed around an open excavation until the excavation is backfilled.
9) Excavated soil will be loaded into trucks and will be properly manifested, truck tires will be decontaminated, and dirt clods will be removed from exterior surfaces such as frame rails.

10) Soil will be transported offsite for disposal at an approved and permitted facility.

11) Post-excavation confirmation soil samples will be collected (Section 3.1.20) to determine whether cleanup goals have been achieved (Section 2).

3.1.9 Excavation Sloping

Occupational Safety and Health Administration Regulations, Title 29 *Code of Federal Regulations* 1926, Subpart P, the *Oregon Safe Employment Act, and Oregon General Administrative Rules, Chapter 437* that govern safety and health regulations for construction will be adhered to and enforced during the soil removal action.

3.1.10 Waste Handling and Disposal

Waste soil (investigation-derived waste) generated during the site investigation was determined to be nonhazardous and was disposed of accordingly (Jacobs 2023b). It is currently assumed that the excavated soil will be managed under the waste profile generated during the site investigation performed in 2022. Where additional data are needed to characterize soils, the site investigation will be used as a starting point for waste profiling.

When possible, waste soil from the excavation will be direct loaded into haul trucks for offsite disposal. For sequencing reasons, stockpiling of waste soil may be necessary. Waste soil stockpiles will be constructed and managed using BMPs identified in the Project-specific Stormwater Management Plan. It is currently assumed that wastewater will be primarily generated from decontamination of sampling equipment and that such waste will be managed under the waste profiles generated during the site investigations performed in 2022.

Soil to be disposed of offsite will be transported via haul trucks to an approved disposal facility. Prior to transportation of contaminated materials, a soil data and certification sheet will be completed as part of the waste acceptance requirement.

Personal protection equipment (e.g., latex gloves) will be identified in the waste profile for soil and will be disposed of with waste soil. General construction debris and municipal waste will be disposed of as general waste at a municipal landfill.

3.1.11 Transportation Plan

Nonhazardous impacted soil that is disposed of offsite will be transported to an appropriate disposal facility. Appropriate licensed and permitted disposal facilities may include:

- Waste Management, Hillsboro Landfill, 3205 SE Minter Bridge Road, Hillsboro, Oregon
- Oil Re-Refining Company (Orrco) – Portland Facility, 4150 N. Suttle Rd., Portland, Oregon

Hazardous impacted soil identified for offsite disposal will be transported under a hazardous waste manifest with a PacifiCorp EPA Identification Number to an appropriate disposal facility. Appropriate licensed and permitted disposal facilities may include:

- Waste Management, Kettleman Hills Facility, 35251 Old, Skyline Road, Kettleman City, California
- U.S. Ecology Nevada Inc., Highway 95 S, Beatty, Nevada

All transportation activities will be performed in strict compliance with applicable regulations and ordinances. The hauling contractor(s) used to transport contaminated waste will be fully licensed and permitted by EPA and the State of Oregon. Department of Transportation and Oregon Highway Patrol safety regulations will be followed.

Transportation equipment will be chosen to safely transport the expected volumes of soil, taking into consideration the types of roads to be traveled and their loading capacity. Trucks will use only preplanned and authorized routes. A detailed log of the loads hauled from the site will be maintained. The waste will be off-loaded for treatment or disposal in a manner consistent with current federal, state, and local regulations.

To minimize the need to decontaminate the truck tires, the construction manager will direct the haul trucks so that they remain on clean areas to the extent possible. During loading, dust emissions will be monitored by the construction manager and mitigated, if necessary, by the excavation contractor. The transportation and disposal contractor will ensure that the hauling trucks will be equipped to fully cover and contain all soil and debris during transportation, thereby preventing spillage or dust emissions.

3.1.12 Spill Prevention and Response Plan

A Spill Prevention and Response Plan will be prepared for responding to and handling onsite spills. All contractors will adhere to the provisions of the Spill Prevention and Response Plan to ensure continued protection of the public safety and the environment.

3.1.13 Fugitive Dust Management

Dust control management measures, including water spraying, will be implemented during soil removal and excavation activities. Only nonpotable water is expected to be used for dust control. The use of dust suppression amendments (Simple Green, Envirotech Vapor Suppressant, or equivalent) will be evaluated on a case-by-case basis prior to use if water alone is not adequate.

3.1.14 Decontamination Procedures

To prevent the unintentional offsite transfer of impacted soil or the spreading of residual impacted soil onsite by construction equipment and personnel, the following decontamination procedures will be implemented:

- The equipment decontamination area will be located in the designated upland staging area away from drainages.
- All equipment wheels/tires will be cleaned over gravel track out pads by appropriate methods.
- Personal protective equipment, such as disposable coveralls and booties, will be removed and stored in the contamination reduction zone.
- All personal protective equipment will be disposed of as discussed in Section 3.1.10.

3.1.15 Stormwater Management Plan

A Stormwater Pollution Prevention Plan will not be needed because the proposed disturbance area is less than 5 acres, consistent with ODEQ 1200 Series Construction Stormwater requirements. Stormwater best management practices (BMPs) instead will be described in the Project-specific Stormwater Management Plan. BMPs will be installed prior to construction activities and implemented throughout the Project duration.

3.1.16 Supplemental Environmental Controls

Other environmental controls may be required in the event that anticipated conditions at the site change. The soil removal actions will be conducted in a manner that will adapt to changing conditions, with appropriate mitigation measures to be developed as needed.

3.1.17 Health and Safety Plan

A Health and Safety Plan will be prepared by Jacobs to address procedures and potential hazards associated with the proposed soil removal action activities. The Jacobs Health and Safety Plan will be prepared to provide pertinent information concerning COPCs, levels of personnel protection, personal protective equipment upgrade action criteria for air monitoring results, monitoring equipment, and physical hazards and safeguards associated with the anticipated field activities. In the event that unanticipated conditions occur, the Jacobs Health and Safety Plan will be modified appropriately.

3.1.18 Contingency Planning

Contingency planning traditionally addresses elements of an action that could not go as planned during project implementation. Should such an event occur, the contingency plan is implemented to deal with the situations. For this Oregon RAP, PacifiCorp has identified several potential elements that could create complications for the cleanup work (Table 3-1). The relative probability of occurrence for each element has not been evaluated; however, PacifiCorp's ongoing coordination with the KRRC team in planning the work reduces the likelihood of some of the more controllable elements occurring (Table 3-1). Somewhat controllable elements related directly to the work include, for example, staffing and landfill issues. The relative risk of elements related to the work should be reduced by coordination and communication among the Project team, with the KRRC, and with other stakeholders, as necessary. Other elements are related to climate or emergency situations (for example, weather and wildfire) and are less controllable but can still be planned for with contingency measures.

Table 3-1. Contingency Planning for Work Associated with Cleanup of Project Sites

Element	Contingency Plan
Contractor or subcontractor equipment or staffing availability	PacifiCorp has been working closely with the contractor to ensure they have the resources available to complete the work. Should that become an issue, additional subcontractors may be brought onto the Project to ensure timely completion of the work.
Injuries or accidents	Any personnel injury, accident, or damage to equipment during the execution of the work will be handled in accordance with the Jacobs Project-specific Health and Safety Plan.
Spill containment and response	Should there be an inadvertent spill or release, the Project-specific Spill Prevention and Response Plan will be followed for initial containment, stabilization, and notification of the KRRC and appropriate state and/or federal agencies.
Changes in waste disposal landfill restrictions	Waste characterization has been conducted as part of the Oregon SI Report. PacifiCorp will likely be collecting new or additional waste characterization samples for review and acceptance by the designated landfills. Additionally, samples will be collected from the Iron Gate Shooting Range to complete waste characterization for this site. In a worst-case scenario, spoils may need to be stockpiled while characterization process and acceptance by the landfill is complete.
Confirmation samples exceeding ESLs	If confirmation samples exceed the target ESLs for a given site and contaminant, PacifiCorp will return to the site, excavate additional soil, and repeat the confirmation sampling per the pattern described in the Oregon RAP. This is an iterative process that could require multiple excavations and testing if contamination is more widely distributed than was indicated in the Oregon SI Report.

Table 3-1. Contingency Planning for Work Associated with Cleanup of Project Sites

Element	Contingency Plan
Discovery of COCs different than what has been documented at a site	The discovery of contaminants present at levels not identified in the Oregon SI Report could result in the recharacterization of waste, changes in disposal methods, or the need for other handling requirements. Any shift in observed subsurface conditions during excavation that could be linked to contamination should result in a stoppage of work so additional investigation can occur. This investigation could lead to changes in the extent of excavation, materials handling, personal protective equipment requirements, or disposal locations.
Access to a Project site is restricted by KRRC work	PacifiCorp is coordinating the work described in this Oregon RAP with the KRRC; however, it is possible that the KRRC's schedule of work changes such that access to a specific location is not possible. In such a case, the contractor will have the flexibility to adjust their schedule and work at other locations until access to an area is available. In a worst-case scenario, the contractor may have to remobilize if there is not another available work location and the site will be inaccessible for an extended period of time.
Wildfire forces evacuation of the area or wildfire smoke creates unsafe work conditions	Safety of PacifiCorp's staff and contractors is of paramount importance. Wildfire-forced evacuations or wildfire smoke that prevents the safe continuation of work are scenarios that have recently occurred in the area and could occur at any time during the work. These are situations for which contingency planning is limited to evacuation routes and appropriate personal protective equipment. In both situations, the contractor will remobilize staff to the site when conditions are safe for continued work. In these cases, schedule delays are likely to be unavoidable.
Discovery of previously undiscovered or unknown contaminants	The approach to managing and addressing the discovery of previously unknown areas of contamination or contaminants is addressed in Section 2.5 of the *Oregon Site Investigation Work Plan Supplement No. 1* (Jacobs 2023a).
Adverse weather (heat/cold)	The work areas for the Project could be subject to extreme temperatures (either hot or cold) that shorten the available amount of time the contractor can work or otherwise create an unsafe working condition. The contractor will comply with all regulations regarding work periods as related to temperature. Adjustments to start times (for example, earlier in the day to avoid heat) could help minimize delays associated with uncontrollable climatic events.
Adverse weather (rainfall)	Precipitation itself is not typically an element that would challenge the Project. However, some of the sites are not easily accessible if the soils become saturated. This could be an issue if the work is delayed into the winter or areas are subject to extreme thunderstorms. In such cases, the contractor will either have to shift work to another accessible area or simply wait for ground conditions to improve. Any stockpiles and work sites would need to be actively managed during this period in accordance with the requirements of the Stormwater Management Plan to ensure they remain stable and do not erode into the surrounding areas.

Table 3-1. Contingency Planning for Work Associated with Cleanup of Project Sites

Element	Contingency Plan
Discovery of cultural resources or human remains	Inadvertent discovery of cultural resources or human remains could result in a delay of excavation while the discovery is evaluated, the appropriate agencies and tribes are consulted, and permission to proceed with work is obtained. This risk has been minimized through prescreening of the work sites. A Jacobs cultural resources monitor will be present at those locations where it is possible to encounter resources or remains and PacifiCorp's Inadvertent Discovery Plan will be followed for all work areas. Coordination with the KRRC's cultural resources team onsite could also help minimize the risk of delay if resources or remains are discovered. If a discovery does occur, the contractor may need to move to a different work area while the significance of a find is addressed and approvals to move forward are obtained.
Potential Claims	Any incident that could lead to a claim affecting KRRC should be promptly reported to KRRC with appropriate reports to follow.

3.1.19 Site Coordination Plan

PacifiCorp recognizes that the areas around Copco, Iron Gate, and J.C. Boyle are active construction sites and as such, careful coordination with the KRRC is required. This coordination has already started and will continue as the contractor mobilization date approaches. The Site Coordination Plan calls for pre-activity meetings between PacifiCorp and the KRRC. The purpose of the meetings is to identify contractor laydown, staging areas, and stockpile locations, set work-hour restrictions, define secured access and badging requirements, and establish scheduling constraints. To date, two pre-activity coordination meetings have been held, the first on June 26, 2023, and the second on July 12, 2023.

During fieldwork execution, the key point of contact between PacifiCorp and the KRRC will be PacifiCorp's Representative (PacifiCorp Rep). At a minimum, the PacifiCorp Rep will communicate the planned work, site location(s), access, and haul routes to the KRRC team during daily meetings. At the daily meetings, any issues raised by the KRRC team will either be addressed directly by the PacifiCorp Rep or will result in a specific follow-up meeting. Specific coordination meetings or site visits for select sites may be required. Those additional coordination meetings or site visits will be scheduled on a case-by-case basis.

In the event of an unforeseen situation that is caused by or creates an emergency situation, the contractor and onsite PacifiCorp Rep would communicate with emergency services, PacifiCorp management, and the KRRC as appropriate. Depending on the situation, a call to 9-1-1 to activate emergency responders would occur first, followed by a call to PacifiCorp's Hydro Control Center, the PacifiCorp Project Manager, and the contractor's own management team. The calls to the Hydro Control Center and PacifiCorp's Project Manager would lead to follow-up calls to others on the PacifiCorp team as appropriate (e.g., compliance, operations, safety, or management staff) and the KRRC.

3.1.20 Confirmation Soil Sampling

In general, confirmation soil samples will be collected from the floor of the excavation and from each excavation sidewall. If bedrock is observed within an excavation floor or sidewall, excavation work will be terminated and a confirmation soil sample will be collected, if appropriate. One confirmation soil sample will be collected from each 750-square-foot section of excavation floor and one confirmation soil sample will be collected from each 25-foot linear section of sidewall. At the sidewall locations, one representative soil sample will be collected from each 2-foot interval (i.e., 0- to 2-foot, 2- to 4-foot, 4- to 6-foot, and 8-

to 10-foot intervals). Additional equally spaced confirmation samples may be collected at the site to ensure an adequate number of samples is available to calculate the site-specific EPC.

Confirmation soil samples will be collected in 4- or 8-ounce glass jars and from the bucket of the excavator/backhoe if the excavation depth exceeds 4 feet below ground surface (bgs). When it is safe to enter excavations shallower than 4 feet bgs, confirmation soil samples will be collected directly into glass jars or by using a decontaminated metal or disposable trowel. Confirmation soil samples for volatile organic compound analysis will be collected as per the existing and approved Sample and Analysis Plan (SAP) (see Appendix A of the SIWP; Jacobs 2021a).

Hand-held soil sampling equipment will be decontaminated prior to the collection of each confirmation soil sample. Prior to sampling, any loose material or soil will be gently brushed off the surface of the excavation, and care will be taken to collect the sample from an undisturbed area.

Confirmation soil samples will be analyzed for the COCs at each site. The laboratory analyses will be performed using the analytical methods and detection limits specified in the SAP (see Appendix A of the SIWP; Jacobs 2021a). The analytical data provided by the analytical laboratory (accredited under the National Environmental Laboratory Accreditation Program) will undergo quality control checks for useability, then uploaded to a database for use in the analysis and reporting process.

The analytical results for the confirmation samples will be compared to the cleanup goals for decision making as follows (Figure 3-1):

- If all samples are below the COC cleanup goals, no further excavation is required.
- If the calculated site wide COC EPCs are below the cleanup goals, no further excavation is required.
- If there are multiple or substantial exceedances, additional excavation may be required.

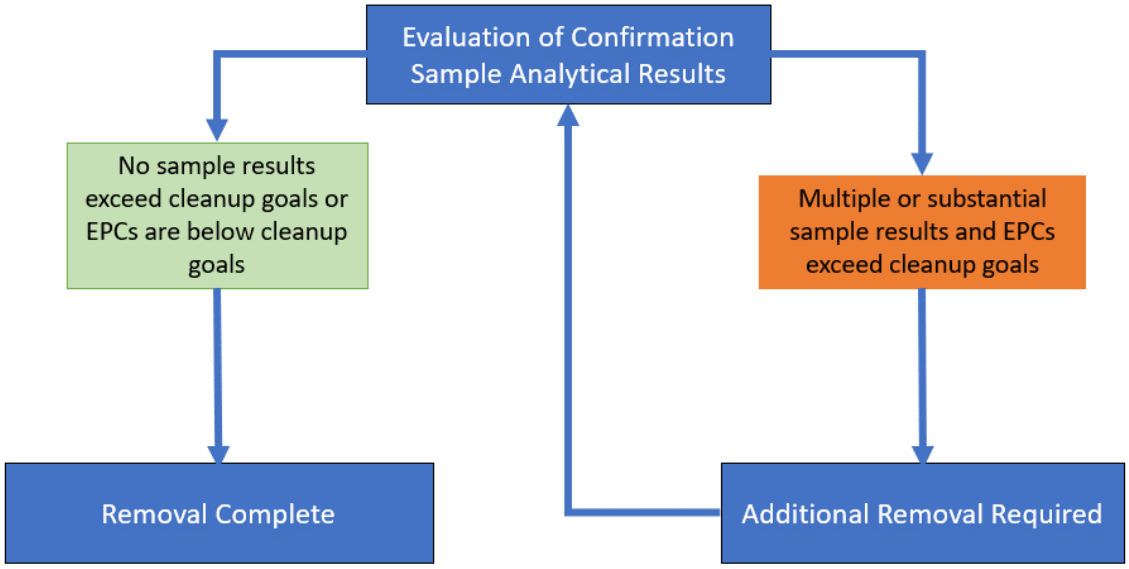

Figure 3-1. Confirmation Sampling Evaluation

Multiple or substantial exceedances will result in deepening and expanding of the excavation. In general, it is anticipated that excavations will be iteratively deepened and expanded in 0.5- to 1-foot increments, or observation of bedrock. Upon expanding the excavation, one step-out confirmation soil sample will be collected for every 750 square feet of newly exposed excavation floor and for every 25 linear feet of newly

exposed sidewall. When multiple COCs are detected at concentrations greater than cleanup goals, cumulative effects will be estimated by summing the ratios of the concentration to cleanup goal for carcinogenic and noncarcinogenic COCs (i.e., the sum of the ratios exceeds 1) to determine if additional soil removal is required.

3.1.21 Backfilling and Site Restoration

PacifiCorp has made initial inquiries to KRRC regarding sourcing of clean backfill soil from onsite construction work associated with dam removal. The intent is to use available soil from ongoing dam-removal work to backfill site excavations resulting from soil removal actions.

Prior to use of this backfill material, these stockpiles will be tested to confirm that constituent concentrations are appropriate for use as clean backfill for the REC excavations.

For stockpiles of less than 1,000 cubic yards, one sample will be collected for every 250 cubic yards. For stockpiles of 1,000 cubic yards or more, four samples will be collected for the first 1,000 cubic yards, and one additional sample will be collected for every additional 500 cubic yards. For example, one sample would be collected from a 100-cubic-yard stockpile, two samples would be collected from a 500-cubic-yard stockpile, and five samples would be collected from a 1,500-cubic-yard stockpile.

Sampling locations will be determined by dividing the length of the stockpile by the number of required samples and creating sampling areas of equal area. One sample will be collected from each area of the stockpile from the side. Each sample will be collected on the opposite side of the pile from any neighboring samples. Sample labeling, handling, analytical methods, quality assurance/quality control procedures, and database entry requirements will follow the same procedures as the California SIWP (Jacobs 2021a).

The analytes and frequency will be selected in general accordance with Department of Toxic Substances Control guidance. The following analytical methods are anticipated, depending on the fill source:

- Polynuclear aromatic hydrocarbon (EPA Method 8270)
- Total petroleum hydrocarbon extractable (EPA Method 8015M)
- Title 22 Metals (EPA Method 6010)

Anticipated procedures for soil backfill placement and compaction are as follows:

- The soil at the bottom of the excavation area will be compacted to the same requirements as the fill that will be placed above it. Excavations will be free of standing water or loose or disturbed materials before placing any fill.
- Fill material will be placed in maximum 8-inch loose lifts and compacted to not less than 90 percent relative compaction per standard Proctor (ASTM D698), unless otherwise specified. Compaction levels will be verified.
- Backfilled areas will be graded to the appropriate subgrade required for surface restoration. The subgrade will be graded to facilitate proper drainage at the site after the surface is restored.
- If required, topsoil will be placed over backfilled areas and prepared for seeding. A commercially available native seed mix will be used for site restoration.

After backfilling and topsoil placement have been completed, construction waste and temporary BMPs will be removed.

3.2 Removal Action Completion Report

Once the soil removal action is complete and the necessary confirmation sampling results have been reviewed and validated, a soil removal action completion report will be prepared to document the soil removal activities that were performed. The report will include:

- A narrative describing the work performed at each site, including an explanation of unexpected findings and required deviations from the original plan.
- Analytical results from confirmation samples.
- Detailed maps of the location and extent of the soil removal activities.
- Documentation of soil excavated and removed from the sites, including final disposition of excavated soil, and documentation of the amount and source of backfill material.
- Copies of necessary permits.
- Annotated photo documentation of the remediation fieldwork.
- Official correspondence, governmental sign-offs, closure letters received from federal, state, and local agencies, or similar communications to be included as an appendix to the report.

4. J.C. Boyle Dispersed Recreation Area – 2

This section summarizes the background and site-specific removal activities for the site. Detailed descriptions of the site background and of the risk assessment results determined upon evaluation of the analytical results from the site assessment are respectively provided in the Oregon SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this Oregon RAP by reference.

4.1 Background

A burn pit, surrounded by stressed vegetation on the north bank of the J.C. Boyle Reservoir approximately 0.4 mile east of Spencer Creek, was documented in the *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020). A review of the photographs in AECOM (2020) indicated that this is a human-made fire ring that may have been spread out after use. The original fire ring appeared to have been 4 or 5 feet in diameter, and the disturbed area was approximately 10 feet by 10 feet, containing ash, charred wood, broken glass, and other debris.

Per the Oregon SI Report, concentrations of lead in soil exceed the ODEQ target RBCs. Concentrations of lead exceeded the leaching to groundwater RBC for soil at one boring. The ERA indicated that potential risks to ecological receptors from soil or groundwater exposure pathways are limited. No chemicals were retained for risk management purposes for ecological receptors.

4.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at the site:

- Excavate an approximate 1,200-square-foot area to a maximum depth of 4 feet bgs or to first encountered groundwater (Figure 4-1).
- Collect one confirmation soil sample along the northern and southern sidewalls and collect two confirmation soil samples along the eastern and western sidewalls.
- Collect two confirmation soil samples from the excavation floor.
- Collect one or two confirmation soil samples at each at each sidewall sample location, based on depth to refusal or observance of groundwater from the Klamath River. The sidewall soil samples will represent unsaturated soil from ground surface to a depth of 2 feet bgs and from 2 to 4 feet bgs.
- Analyze the soil samples to confirm lead is below the background concentration (34 mg/kg). Table 4-1 summarizes the confirmation sampling plan for the site.
- Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.

Table 4-1. Confirmation Sample and Analysis Plan for Soil at J.C. Boyle Dispersed Recreation Area-2

COMMENT MATRIX for the Stakeholder Review Draft Dated June 2023
Lower Klamath Hydroelectric Project Soil Removal Action Plans for California and Oregon
FERC No. P-14803
September 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
California Department of Fish and Wildlife - Office of Spill Prevention and Response/California Department of Water Resources (Comments on the Soil Removal Action Plan for California)					
CA-1	KT	General Comment		The California RAP states that soil cleanup goals are risk-based concentrations that are protective of human health and leaching to groundwater. It is unknown if dilution factors for transport between groundwater and surface water were considered in the risk analysis. CDFW-OSPR reiterates that if sufficient validation is not available for a specific dilution factor, please make the conservative assumption that there is no dilution of contaminants between ground and surface waters. If groundwater at Copco No. 2 Wood-Stave Penstock and Wood Pile (Parcel B REC 7) is hydraulically connected to the water of Klamath River, PacifiCorp/Jacobs must ensure contaminants do not enter State waters at levels deleterious to fish, mammals, plant life or bird life (Fish and Game Code section 5650).	PacifiCorp did not apply a groundwater dilution factor to surface water. The San Francisco Regional Water Quality Control Board (SFRWQCB) environmental screening levels (ESLs) used in this investigation pertaining to soil leaching (SFRWQCB 2019) are protective of freshwater habitat. As stated in Section 3.2 of the California Site Investigation Report: "Soil leaching values for protection of freshwater habitat were evaluated for COPCs at each site." The freshwater aquatic habitat screening levels and sources are listed in Table GW-2 of the 2019 ESL Workbook (SFRWQCB 2019). The most conservative freshwater habitat screening level for groundwater/surface water is used to determine the soil leaching values as presented in Table S-3 of the 2019 ESL Workbook (SFRWQCB 2019). Therefore, contaminants that enter State waters at concentrations less than the screening levels for soil leaching are protective of freshwater habitat, including fish, mammals, plant life, and bird life. Termination of water flow within the penstock has eliminated the water source and disconnected any hydraulic connection between the water accumulated water beneath the penstock and the Klamath River. PacifiCorp expects the soil removal action to demonstrate that: (1) soil beneath the penstock has dried out, thereby removing a hydraulic connection; and (2) site-specific constituents of concern (COCs) with concentrations greater than acceptable soil leaching screening levels have been removed (to be demonstrated based on the analytical results of excavation floor and sidewall confirmation samples). Groundwater was not encountered during sampling and the depth to groundwater is not known at the Wood Pile (Parcel B REC 7). The soil removal action is expected to demonstrate that site-specific COCs with concentrations greater than acceptable soil leaching screening levels have been removed (to be demonstrated based on the analytical results of excavation floor and sidewall confirmation samples). No changes necessary.
CA-2	KT	Soil Removal Action Plan for California	Page 3-1, Section 3, Implementation Plan	The California RAP should include the following plans: - Contingency Plan - Site Coordination Plan Please add the above plans into the California RAP and change "Spill Response Plan" to "Spill Prevention and Response Plan."	Section 3.1.18, Contingency Planning has been added. Section 3.1.19, Site Coordination Plan has been added. Section 3.1.12, Spill Response Plan has been changed to "Spill Prevention and Response Plan." The same edits have been made to the Oregon Soil Removal Action Plan.
CA-3	KT	Soil Removal Action Plan for California	Page 3-1, Section 3.1.4, Mobilization and Site Preparation	CDFW requests that a biological monitor be on site during mobilization and throughout all field activities to ensure that wildlife are not impacted by site activities, and that any impacts to special status species are minimized. Please also include the following biological avoidance, minimization, and mitigation measures to be implemented for the protection of special status species that may be present on or near the site during field activities. i. CDFW would typically require pre-construction biological surveys by a qualified biologist approved by CDFW, however CDFW assumes that much of KRRC's pre-construction clearance work would overlap with the clean-	PacifiCorp has added Section 3.1.4, Biological Resources, which reads as follows: "The following biological avoidance, minimization, and mitigation measures will be implemented for the protection of special-status species that may be present on or near the site during field activities: ▪ A preconstruction biological assessment will be completed by a qualified biologist to review potential effects on biological resources before removing debris and implementing the soil removal actions at each site. This will include all removal areas, staging and laydown areas, and undeveloped access routes.

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
				up activities. To confirm CDFW's assumption, please identify where all project activities will occur (e.g., access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas). If project activity will occur in an area outside of KRRC's pre-construction clearance work then a survey should be performed. ii. A qualified biologist shall conduct a Biological Resource Education Program briefing to all contractor and subcontractor personnel prior to any site entry. To be considered as qualified, the biologist will be experienced with and knowledgeable about the special status species and habitats present or potentially present on or adjacent to the site. The qualified biologist shall train all personnel on the location of sensitive habitat, identification of all special status species, instructions of procedure when encountering one, and general environmental laws. New employees will attend a briefing by the qualified biologist prior to participating in work activities. iii. If remedial activities occur during the nesting season (February 1 - September 15), a focused survey for nesting birds shall be conducted by a qualified biologist for all access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas 1 to 2 weeks prior to commencement of any project activities or a return to work activities. The qualified biologist must survey the work area and all natural habitats occurring within 500 feet of the work area, to identify active nests. The qualified biologist shall look for new nests at least twice per week during remedial activities that occur during nesting season. iv. If nesting birds are found during surveys, CDFW shall be notified, the locations shall be identified on a map, and no project activity shall occur within 250 feet for raptors and 100 feet for other non-listed birds of an identified active nest until the young have fledged (as determined by a qualified biologist) or until the project proponent receives authorization from CDFW to proceed. If a qualified biologist and CDFW determine the project activity would not be likely to adversely affect the nest, CDFW may authorize the project proponent to proceed. The qualified biologist shall remain on site to monitor the activity of the nesting birds during work activities. If the birds behave normally, the qualified biologist shall monitor them twice per week to ensure the status has not changed. If the birds change their behavior as a result of work activities, the qualified biologist shall continue to monitor the birds as work is modified until the birds act normally. The qualified biologist shall then monitor the birds twice per week to ensure the status has not changed. Through consultation with CDFW, measures will be developed to minimize impacts to nesting birds. Vegetation containing nests that must be removed as a result of project implementation shall be removed during the non-nesting season (September 16 – January 31).	▪ All field team members, including the removal contractor and lower-tier subcontractors, will complete the online KRRC Biological Resource Training program as part of premobilization activities. ▪ A preconstruction nesting survey will be completed by a qualified biologist for sites with remedial activities planned to occur during the nesting season (February 1 – August 31). If nesting birds are found during surveys, the California Department of Fish and Wildlife (CDFW) will be notified, and no Project activity will occur within 250 feet for raptors and 100 feet for other nonlisted birds until a site-specific mitigation and monitoring plan has been developed (including reporting requirements) and agreed upon with CDFW." Note that PacifiCorp adjusted the end date from September 15 as suggested in the comment to August 31 so that the ending of the nesting bird period is consistent between the OR and CA RAPs and the dates in the RAPs are now consistent with the KRRC's approvals and permits. The following bullet was added to Section 3.1.14, Decontamination Procedures: ▪ The equipment decontamination area will be located in the designated upland staging area away from drainages. Section 3.1.2, Traffic Control, now reads as follows: "As necessary, traffic management will be implemented to manage the safe entry and exit of vehicles from the site. Equipment and personnel will be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas. Upland routes covered with pavement, bare ground, or non-native vegetation will be utilized as access routes to and from the excavation sites to the maximum extent practicable." Similar edits have been made to the Oregon Soil Removal Action Plan.

COMMENT MATRIX for the Stakeholder Review Draft Dated June 2023
Lower Klamath Hydroelectric Project Soil Removal Action Plans for California and Oregon
FERC No. P-14803

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
				v. Equipment and personnel shall be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas. vi. The equipment decontamination area shall be located in the designated upland staging area away from drainages. vii. Upland routes covered with pavement, bare ground, or non-native vegetation shall be utilized as access routes to and from the excavation sites, to the maximum extent practicable. The qualified biologist shall complete a monitoring report for each day of monitoring, to include at a minimum: the date, location, weather, biologist's name, remedial activities occurring, special status species observed, species behavior in relation to remedial activities, and any corrective measures taken to protect the species. The biological monitoring reports should be submitted to CDFW for the duration of the remedial activities.	
CA-4	KT	Soil Removal Action Plan for California	Page 3-5, Section 3.1.16, Confirmation Soil Sampling	Please add statements or paragraphs in the section as follows: i. If the data fall outside the limit of specified accuracy, precision, and recovery, or have problems that affect comparability, the laboratory leader must contact the Quality Assurance Officer (QAO) and discuss available options to correct or rectify the situation. The QAO will have final authority on decisions made for correcting or rectifying problems. ii. Quality assurance reports will be prepared annually by the QAO and will include a detailed report of data precision, accuracy, and completeness for each type of analysis. Included in the final laboratory report will be a summary of the practices used to assess data precision, accuracy, and completeness. The QAO will review and approve these reports and include results of performance and system audits, and corrective actions that have occurred. iii. All significant quality assurance problems will be reported to the QAO as soon as possible along with recommendations for corrective action. iv. Any changes in quality assurance procedures, analytical procedures, sampling locations and frequencies, etc., will be submitted in writing to the QAO for approval prior to implementation of the changes.	The following language has been added to Section 3.1.20 consistent with the California Site Investigation Work Plan: "The analytical data provided by the analytical laboratory (accredited under the California Environmental Laboratory Accreditation Program) will undergo quality control checks for useability, then uploaded to a database for use in the analysis and reporting process." Additionally, Jacobs' internal, project-specific Quality Assurance Project Plan will be followed. All analytical data from the laboratory will be validated and evaluated by a qualified project chemist for quality assurance/quality control purposes. The results of the data validation and evaluation will be summarized in a Data Validation Report(s) that will be included in the California and Oregon Soil Removal Action Plans. This is the same process as was done for the California and Oregon Site Investigation Reports. The same language has been added to the Oregon Soil Removal Action Plan.
CA-5	KT	Soil Removal Action Plan for California	Page 3-7, Section 3.1.17, Backfilling and Site Restoration	It is unclear how habitat restoration will be conducted following excavation. The work site should be revegetated with native plants to restore the habitat and to prevent erosion of bare soils/backfill. Please include a description of the habitat restoration methods to be implemented, including seed mix and success criteria, to be used following habitat disturbance associated with the remediation. The habitat restoration plan should be submitted to the regulatory agencies for review and approval prior to implementation. We agree that the Iron Gate Shooting Range need only be stabilized to prevent erosion and dust in the most cost effective manner until KRRC places spoils on the site.	The work sites will be restored and stabilized in accordance with the requirements of the Stormwater Pollution Prevention Plan. This will include backfill and seeding with a native seed mix. The last bullet in Section 3.1.21, Backfilling and Site Restoration, has been modified to read as follows: ▪ If required, topsoil will be placed over backfilled areas and prepared for seeding. A commercially available native seed mix will be used for site restoration.

COMMENT MATRIX for the Stakeholder Review Draft Dated June 2023
Lower Klamath Hydroelectric Project Soil Removal Action Plans for California and Oregon
FERC No. P-14803
September 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
Klamath River Renewal Corporation (Comments on the Soil Removal Action Plans for California and Oregon)					
KRRC-General-1	LL	General Comment		All hazardous wastes are to be reported under PacifiCorp's EPA ID number	Acknowledged. In part, Section 3.1.11, Transportation Plan, now reads as follows: "Hazardous impacted soil identified for offsite disposal will be transported under a hazardous waste manifest with a PacifiCorp EPA Identification Number to an appropriate disposal facility." The same edit has been made to the Oregon Soil Removal Action Plan.
KRRC-General-2	LL	General Comment		Summaries of previously reviewed documents or materials are subject to such documents or materials in their entirety	Acknowledged. No changes necessary.
KRRC-General 3	LL	General Comment		Statements of future actions (e.g., closure determinations) remain subject to such facts and circumstances as may be known at the time in question	Acknowledged. No changes necessary.
KRRC-General 4	LL	General Comment		Removal activities are subject to coordination with KRRC	Acknowledged. PacifiCorp, Jacobs, and the KRRC's demolition contractors met on June 26 and July 12, 2023, to discuss project specifics. Additional meetings will be held per the Site Coordination Plan (see Comment CA-2 and Section 3.1.19).
KRRC-General 5	LL	General Comment		Removal Action Completion Reports (Section 3.2 in each plan): ▪ Should also include a narrative description of the work performed at each site, including a description and explanation of any unexpected findings and any deviations from the original plan. ▪ Any official correspondence, governmental sign-offs, closure letters received from federal/state/local agencies or similar communications should be included as an appendix to the Report.	The first bullet of Section 3.2, Removal Action Completion Report, now reads as follows: ▪ A narrative describing the work performed at each site, including an explanation of unexpected findings and required deviations from the original plan. The last bullet of Section 3.2 now reads as follows: ▪ Official correspondence, governmental sign-offs, closure letters received from federal, state, and local agencies, or similar communications to be included as an appendix to the report. The same edits have been made to the Oregon Soil Removal Action Plan.
KRRC-General 6	LL	General Comment		KRRC adopts such additional comments as either of the States may have.	Acknowledged. No changes necessary.
KRRC-1	LL	Soil Removal Action Plan for Oregon		No substantive comments. (A couple of typos that I'll send you separately.) [See below.] ▪ Section 3.1.3 - 1st bullet: "will approval" should probably be "will approve" ▪ Section 3.2 – 1st sentence: "… prepared to document that the soil removal activities that were performed …" Delete the highlighted "that"?	Acknowledged and received. Typos corrected.
KRRC-2	LL	Soil Removal Action Plan for California		No substantive comments on sites other than the wood-stave penstock.	Acknowledged. No changes necessary.
KRRC-3	LL	Soil Removal Action Plan for California	Wood-Stave Penstock	Regarding the wood-stave penstock: What is the reasoning behind only excavating the wood-stave penstock site to a depth of 1 [foot] bgs?	Per the California SI Report, pentachlorophenol and various polynuclear aromatic hydrocarbon (PAHs) [i.e., benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene] were identified in concentrations greater than acceptable

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
				▪ Is this due to suspected proximity to bedrock or for a different reason? ▪ What level of confidence do we have that 1 [foot] bgs is sufficient to remove all soil contaminated with PCP from the penstock site? This site is above standards for groundwater leaching to nondrinking water for pentachlorophenol (PCP) and is in close proximity to the river.	human health risk levels at soil borings C2WS-02, C2WS-04, C2WS-05, C2WS-06, C2WS-07, C2WS-08, C2WS-13, C2WS-14, C2WS-15, and C2WS-16 (Table D-2 of the CA SI Report). At soil borings C2WS-02, C2WS-04, C2WS-07, C2WS-08, and C2WS-14, unacceptable human health risk levels were identified in soil samples collected from surface grade to a depth of 0.5 foot bgs. Consequently, soil in the vicinity of these borings will be excavated to a depth of 1 foot bgs, and then confirmation soil samples will be collected to confirm that COCs are no longer present at concentrations greater than acceptable human health risk levels. If COCs are detected at concentrations greater than acceptable human health risk levels, over-excavation will be performed, where required and where possible (i.e., when not obstructed due to the presence of bedrock or boulders). At soil borings C2WS-05, C2WS-06, C2WS-13, C2WS-15, and C2WS-16, unacceptable human health risk levels were identified in soil samples collected at depths ranging from 0.5 foot to 1.5 feet bgs (borings C2WS-05, C2WS-06, and C2WS-16), 1.5 to 2.5 feet bgs (boring C2WS-15), and 2.0 to 3.0 feet bgs (boring C2WS-13). It is assumed that rocks and boulders will prevent significant over-excavation in the immediate vicinity of these borings. It is also assumed that the analytical results from confirmation sampling will demonstrate that COCs are no longer present at concentrations above acceptable human health risk levels. If COCs are detected at concentrations greater than acceptable human health risk levels, over-excavation will be performed, where required and where possible (i.e., unobstructed by bedrock or boulders). Figure 4-1 has been revised and Section 4.2 has been reworded as follows: "The following site-specific removal actions will be performed at the penstock with the understanding that boulders, bedrock, or both, may limit the vertical and lateral extents of the excavation: ▪ Excavate an approximate 50,000-square-foot area to a minimum depth of 1 foot bgs, or refusal (Figure 4-1). ▪ Based on an evaluation of analytical and risk assessment data from former soil borings C2WS-05, C2WS-06, and C2WS-16 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Locations 2, 3, and 5 to a depth of 3 feet bgs or refusal (Figure 4-1). ▪ Based on an evaluation of analytical and risk assessment data from former soil boring C2WS-15 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Location 4 to a depth of 4 feet bgs or refusal (Figure 4-1). ▪ Based on an evaluation of analytical and risk assessment data from former soil boring C2WS-13 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Location 1 to a depth of 4.5 feet bgs or refusal (Figure 4-1). ▪ Where the initial excavation depth is 1 foot bgs, collect confirmation soil samples along the northern and southern sidewalls. The sidewall samples will be spaced approximately 50 feet apart and will represent soil from ground surface to the bottom of the excavation. Also collect confirmation soil samples from the excavation floor. The floor samples will be spaced approximately 50 feet apart (Figure 4-1; Table 4-1).

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
					▪ Where the initial excavation depths are 3, 4, or 4.5 feet bgs, collect one confirmation soil sample from the excavation floor. ▪ Where the initial excavation depths are 3, 4, or 4.5 feet bgs, collect confirmation soil samples from each excavation sidewall. Collect two soil samples from the respective northern and southern sidewalls of these deeper excavation areas. One sidewall sample will represent soil from ground surface to the midpoint of the excavation, and one sidewall sample will represent soil from the midpoint to the bottom of the excavation. Soil samples from the eastern and western sidewalls will represent soil from 1 foot bgs to the bottom of the excavation. ▪ Analyze the soil samples for pentachlorophenol and the following PAHs: benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene (Table 4-1). ▪ Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.
KRRC-4	LL	Soil Removal Action Plan for California	Section 4.0	[Section] 6.7 of CA SIR states: "Additional investigation at this site following removal of the penstock may be warranted to refine the preliminary excavation area (Figure 6-2)." ▪ This appears to have been omitted from Section 4 of the California Soil Removal Action Plan. ▪ Will additional investigations at this site be performed prior to the start of excavation to determine the extent of PCP contamination and refine the preliminary excavation area? ▪ The SIR noted issues with investigative shovel probes at the penstock due to the presence of groundwater in the soil (suspected to be the result of the leaking penstock).	Additional investigation following removal of the penstock is no longer considered warranted given the overall dam removal and cleanup schedules. PacifiCorp has opted to excavate the area indicated (see Figure 4-1) and properly dispose of the soil offsite rather than iteratively perform additional site investigations with risk assessments and report review cycles. Consequently, the soil removal action will be performed as described in Section 4 of the California Soil Removal Action Plan. Over-excavation and confirmation sampling will also be performed, where required (see Comment KRRC-3 and Section 4.2). No additional changes are necessary.

Lower Klamath Hydroelectric Project Soil Removal Action Plans for California and Oregon
FERC No. P-14803
September 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
KRRC-5	LL	Soil Removal Action Plans for California and Oregon	As indicated in bulleted comment	We'd like some clarification that PacifiCorp, Jacobs and their contractors will act in a manner that is consistent with KRRC's management plans (e.g., transportation, historic properties, etc.). For example: • Section 3.1.2 of the SRAP for each State refers to designated routes, staging and storage areas but does indicate that these will be as provided for in KRRC's transportation plan • Section 3.1.3 of the SRAP for each State refers to archeological monitoring but does not make clear that any such monitoring must be coordinated with KRRC's cultural resources team • Section 3.1.17 of the SRAP for each State refers to a Health and Safety Plan but does not make clear whether this will be KRRC's plan or one developed by Jacobs? If the latter then it must be consistent with KRRC's (See also the "Injuries or Accidents" Section of Table 3-1) • The last box in Table 3-1 of the SRAP for each State refers to the unexpected discovery of cultural resources. Again we'd like clarity as noted regarding Section 3.1.3 above. In addition, there's reference to an Inadvertent Discovery Plan that will apply if cultural resources are unexpectedly encountered – again, we'd like better clarity on whether this be KRRC's plan or one developed by Jacobs? If the latter then it must be consistent with KRRC's	PacifiCorp has been in close coordination with the onsite KRRC team as this removal plan has been developed and will continue to work with the KRRC's team as it is implemented; however, PacifiCorp is relying on the KRRC's team, through these comment periods, to identify areas of substantive conflict between the removal plans and the dam removal management plans. To date, no areas of conflict have been identified by the KRRC. Should an issue or conflict develop during implementation, PacifiCorp will work through that issue with the KRRC team. Responses for each bullet are provided as follows: • Staging and storage areas are specific to the removal action work and removal contractor needs. These areas have been identified in coordination with the KRRC team onsite (McMillen and Kiewit) and will continue to be coordinated through the execution of the work as indicated in Section 3.1.19, Site Coordination Plan. No additional changes are necessary. • The following text has been added to Section 3.1.3: *"Should cultural monitoring result in the inadvertent discovery of culturally sensitive resources, the Jacobs team will notify the KRRC's cultural resources team."* • The text in Section 3.1.17 and Table 3-1, Injuries and Accidents row (Table 3-2 in the California RAP) has been modified to clarify that Jacobs prepared the subject Health and Safety Plans. • Table 3-1 (Table 3-2 in the California RAP), Discovery of Cultural Resources or Human Remains, has been updated to indicate that cultural monitoring will be performed by Jacobs. This section already refers to the PacifiCorp's Inadvertent Discovery Plan and coordination with the KRRC's cultural resource team.
KRRC-6	LL	Soil Removal Action Plans for California and Oregon	Section 2, Risk Assessment Summary and Cleanup Goal	We'd like some clarification on risk management and contingency planning as follows: • Any incident that could lead to a claim affecting KRRC should be promptly reported to KRRC with appropriate reports to follow	This text has been added to Table 3-1 (Table 3-2 in the California RAP), Contingency Planning for Work Associated with Cleanup of Project Sites.
KRRC-General 7	LL	General		We incorporate any further comments either of the States may have.	Acknowledged. PacifiCorp recognizes that this line duplicates KRRC-General 6. The same comment was received twice and is included here for completeness. No changes necessary.

* LL = Lloyd Lowy

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
Oregon Department of Justice (Comments on the Soil Removal Action Plan for Oregon)					
OR-1	CM	General Comment		As you know, any such comments are not to be construed in any way as an Oregon approval regarding remediation process – all such work must be completed by PacifiCorp as per the relevant property transfer agreements and related agreements notwithstanding any communications as to the process. With that said, we continue to note that your plan makes no mention of any cultural resource monitoring and inadvertent discovery plan. By separate email you have indicated that such plans will be in place. Please confirm. Also, the plan for water for dust abatement will likely require hauling from offsite and/or an OWRD permit for any local pumping.	The cleanup locations have all been reviewed in relation to the potential for cultural resources to be present. Some sites have been precleared and will require no cultural resources monitoring. Others are in proximity to known cultural sites and will require monitoring during cleanup. Regardless of the presence of monitors, PacifiCorp's inadvertent discovery plan will remain in place for all work. Section 3.1.3, Cultural Resources has been added to the Oregon Soil Removal Action Plan. Given the limited amount of work and relatively small work areas in Oregon, water for dust control is not expected to be necessary. If it is necessary, water will either be obtained via permit from the Oregon Water Resources Department or from PacifiCorp's J.C. Boyle Development per an existing water right.

1. Introduction

PacifiCorp retained Jacobs Engineering Group Inc. (Jacobs) to prepare this *Soil Removal Action Plan for California* (California RAP) for the Lower Klamath Hydroelectric Project (Project). The purpose of the California RAP is to document how soil removal activities will be performed at six recognized environmental conditions (RECs) within the Copco No. 2 and Iron Gate developments in California.

Five of the six RECs (the term "site" is used interchangeably with REC in this plan) were originally identified during Phase I environmental site assessments (Phase I ESAs) conducted by AECOM Technical Services, Inc. (AECOM) on behalf of the Klamath River Renewal Corporation (KRRC) and were subsequently identified in Exhibit C of a Property Transfer Agreement (Agreement) between PacifiCorp, KRRC, and the States of California and Oregon. PacifiCorp elected to include the Copco No. 2 Powerhouse Transformer C Fire site, when assessing the Exhibit C sites under the *California Site Investigation Work Plan* (California SIWP) (Jacobs 2021a) to confirm the presence or absence of constituents of potential concern (COPCs) or the extent of COPCs previously identified. The sites addressed under this California RAP are as follows (Figures 1-1 to 1-3):

1) Copco No. 2 Wood-Stave Penstock
2) Copco No. 2 Wood Pile (Parcel B REC 7)
3) Copco No. 2 Powerhouse Transformer C Fire (not included in Exhibit C of the Agreement)
4) Copco No. 2 Burn Pit (Parcel B REC 6)
5) Iron Gate Shooting Range (Parcel B REC 9)
6) Iron Gate Hatchery Burn Pit

This California RAP will additionally be utilized should any sites addressed under the *California Site Investigation Work Plan Supplement No. 1* (Jacobs 2023a) require a soil removal action.

PacifiCorp intends that approval of this California RAP will constitute endorsement of the plan from KRRC and the State of California. Following implementation of the RAP and completion of documentation affirming that the cleanup goals defined in this RAP have been met, the RECs will be ready for closure. As used in this California RAP, site closure refers to a closure action agreed upon by PacifiCorp, KRRC, and California and documented in a Memorandum of Resolution.

1.1 Background

The California SIWP provides detailed background information on the Copco No. 1, Copco No. 2, and Iron Gate Dam developments, further defines the Exhibit C RECs, and contains a discussion of the surrounding lands, local geology, and historical practices (Jacobs 2021a). The California SIWP was approved by KRRC (Lowy, pers. comm. 2021) and the State of California. A separate *Oregon Site Investigation Work Plan* (Oregon SIWP) was developed for the J.C. Boyle Development and its single REC, the J.C. Boyle Dispersed Recreation Area – 2 (Jacobs 2021b). The Oregon SIWP was approved by KRRC (Lowy, pers. comm. 2021) and the State of Oregon (Matthews, pers. comm. 2021).

The findings of the various site assessments were documented in the *California Site Investigation Report* (California SI Report) (Jacobs 2023b), in the *Oregon Site Investigation Report* (Jacobs 2023c), and in accordance with Section 4 of each SIWP. A separate *Soil Removal Action Plan for Oregon* was prepared for the J.C. Boyle Dispersed Recreation Area – 2 (Jacobs 2023d).

The California SI Report recommended soil removal actions for the RECs identified in this California RAP. The California SI Report also recommended closure for several Exhibit C sites based on the results of the site investigations and subsequent evaluation of the analytical data.

1.2 Removal Action Plan Objectives

The primary objectives of this California RAP are as follows for each site:

- Identify the general field activities that will be performed in support of the soil removal actions.
- Identify the unique, site-specific field activities that will be performed in support of the soil removal actions.
- Identify the confirmation soil sampling requirements for each REC upon removal of the initial soil volumes recommended in the California SI Report.
- Identify the remedial action objectives and define the process that will be used to demonstrate the remedial action objectives have been met.

1.3 Investigative Standard and Future Site Uses

The initial contaminants of potential concern (COPCs) for each site were determined based on the Investigative Standard, as defined in Section 1.5 of the California SIWP (Jacobs 2021a), on expectations for the type of site identified, and where applicable, on identified COPCs from prior site assessments. All fieldwork and data evaluations were additionally carried out in accordance with the Investigative Standard. The COPCs, intended future site uses, and exposure pathways for each site were approved by KRRC and the State of California. The exposure pathways were used to determine the screening levels developed in Section 3.3 of the California SIWP and to evaluate the analytical results in Sections 5 through 13 of the California SI Report (Jacobs 2023b). The associated information in these documents is incorporated into this California RAP by reference.

The constituents of concern (COC) for each site (Table 1-1) were established in the California SI Report and are the basis for the soil removal actions and confirmation sampling under this California RAP. The COCs were determined based on 1) the future site uses; 2) utilization of the Investigative Standard when investigating the site under the California SIWP and evaluating the analytical data under the California SI Report; and 3) the results of the risk assessments (human health, leaching to groundwater, and ecological) that were performed in the California SI Report (summarized in Section 2 of this California RAP).

When working under this California RAP, confirmation soil samples will be collected in accordance with the Investigative Standard presented in the California SIWP and SI Report.

1.4 Report Organization

This California RAP contains the following sections and appendix:

- **Section 1 – Introduction**: States the purpose of the California RAP, provides background information on the evolution of the RECs and determination of the COCs for each site, specifies the California RAP objectives, and describes the investigative standards and future site uses.
- **Section 2 – Risk Assessment Summary and Cleanup Goals**: Describes the risk assessment approach and summarizes cleanup goals.
- **Section 3 – Implementation Plan**: Provides a general overview of how the soil removal actions will be conducted.
- **Sections 4 to 9 – Backgrounds and Site-Specific Removal Actions by Site**: Summarize the background and site-specific removal actions for each REC.
- **Section 10 – References**: Provides a bibliographic listing of documents cited in this California RAP.
- **Appendix – Consolidated Comment Matrix**: Contains consolidated review comments and responses from KRRC, California, and Oregon related to this California RAP.

Table 1-1. Future Site Uses, Risk Drivers, and Constituents of Concern

Site/REC		Future Site Use	Risk Driver	Constituents of Concern
Copco No. 2 Wood-Stave Penstock		Passive Recreation/Natural Habitat	Human Health and Leaching to Groundwater	PCP and PAHs (BaP, BbF, DahA)
Copco No. 2 Wood Pile No. 2		Passive Recreation/Natural Habitat	Leaching to Groundwater	PCP
Copco No. 2 Powerhouse Transformer C Fire		Active Recreation	Human Health	DRO, PAHs (BaP, DahA), PCBs (Aroclor 1262)
Copco No. 2 Burn Pit	Backhoe Parking Area	Passive Recreation/Natural Habitat	Human Health	DRO
	Burn Pit			Dioxin (2,3,7,8-TCDD TEQ) and Naphthalene
	Concrete Rubble Area			PAHs (BaA, BaP, BbF, DahA, 1cdP)
Iron Gate Shooting Range		Passive Recreation/Natural Habitat	Human Health	Lead
Iron Gate Hatchery Burn Pit		Passive Recreation/Natural Habitat	Exceeds Background	Arsenic

Notes:

BaA = benzo(a)anthracene

BaP = benzo(a)pyrene

BbF = benzo(b)fluoranthene

DahA = dibenzo(a,h)anthracene

DRO = diesel range organics

IcdP = indeno(1,2,3-cd)pyrene

mg/kg = milligrams per kilogram

PAHs = polyaromatic hydrocarbons

PCB = polychlorinated biphenyl

PCP = pentachlorophenol

REC = recognized environmental concern

2. Risk Assessment Summary and Cleanup Goals

This section summarizes the risk assessment conducted in 2022 (Jacobs 2023b) and the cleanup goals derived from the risk assessment results.

2.1 Risk Assessment Summary

This section describes the general risk assessment approach used to evaluate human health risk, leaching to groundwater, and ecological risk from COPCs in soil at all sites, and human health risk from COPCs in groundwater at three sites. Risk managers used the results of this analysis to support risk management decisions for each site. The detailed risk assessment approach and results are described in further detail in the California SI Report (Jacobs 2023b).

2.1.1 Human Health Risk Assessment

A streamlined human health risk assessment (HHRA) was conducted for each site to evaluate human health risk to applicable receptors from exposure to contaminants in soil and groundwater. The HHRA provides information that can support risk-management decision making, including the need for further action.

This HHRA was conducted in a manner consistent with the following California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) guidance:

- *Human Health Risk Assessment Note Number 2 - Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites* (DTSC 2017)
- *Human Health Risk Assessment Note Number 1 – Recommended DTSC Default Exposure Factors for Use in Risk Assessment at California Hazardous Waste Sites and Permitted Facilities* (DTSC 2019)
- *Human Health Risk Assessment Note Number 3 – DTSC Recommended Methodology for Use of U.S. EPA Regional Screening Levels (RSLs) in Human Health Risk Assessment Process at Hazardous Waste Sites and Permitted Facilities* (DTSC 2022a)
- *Human Health Risk Assessment Note Number 4 – Guidance for Screening Level Human Health Risk Assessments* (DTSC 2022b)

The HHRA framework consists of the following four basic steps (EPA 1989):

1) Data Evaluation: The first step consists of reviewing and evaluating available data, identifying COPCs in media at each site.
2) Exposure Assessment: The second step involves evaluating potential exposure pathways for COPCs and the potential human populations that could be exposed to them, either now or in the future. In this step, exposure point concentrations (EPCs) are estimated from measured or modeled concentrations, and pathway-specific exposure parameters and assumptions are evaluated.
3) Toxicity Assessment: The third step comprises compiling toxicity values that characterize potential adverse health effects from exposure to COPCs and that are used to estimate potential risks to human health.
4) Risk Characterization**:** The fourth step combines the results of the previous three steps to quantitatively characterize potential risks to human health associated with exposure to COPCs at the RECs evaluated. Potential cancer risk and adverse noncancer health effects are estimated. Uncertainties in risk characterization are discussed.

2.1.2 Ecological Risk Assessment

A streamlined ecological risk assessment (ERA) was completed for each site to evaluate potential risks to ecological receptors from contaminants in soils under current and potential future land use conditions. The results of the streamlined ERA were used in conjunction with the HHRA and leaching to groundwater evaluation to provide risk managers with information needed to support risk management decisions.

The streamlined ERAs were performed in general accordance with U.S. Environmental Protection Agency (EPA) and DTSC guidance as follows:

- *The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (EPA 2001)
- *Guidelines for Ecological Risk Assessment* (EPA 1998)
- *Ecological Risk Assessment Guidance for Superfund: Process for Designing and Conducting Ecological Risk Assessments, Interim Final* (EPA 1997)
- *Guidance for Ecological Risk Assessment at Hazardous Waste Sites and Permitted Facilities* (DTSC 1996)

The streamlined ERAs were conducted in a phased approach as follows:

- Step 1 – Screening Evaluation: The screening evaluation consists of a very conservative (i.e., protective of the most sensitive ecological receptors) screen of sample-specific detected results for the site compared to available background threshold values and the No Effect Ecological Screening Level (No Effect ESL). Chemicals with observed concentrations that do not exceed the No Effect ESLs are considered to not pose a potential risk to ecological receptors and are eliminated from further evaluation. Chemicals with detected concentrations exceeding the No Effect ESLs are carried forward to Step 2 (Refined Evaluation).
- Step 2 – Refined Evaluation: The refined evaluation consists of a comparison of sample-specific results against a refined screening level that is based on a lowest observed adverse effect level for wildlife. The chemicals with observed concentrations that do not exceed the Low Effect ESL are considered to not pose a significant risk to ecological receptors. Chemicals with detections exceeding the Low Effect ESL are carried forward to Step 3 (Site-Specific Evaluation).
- Step 3 – Site-Specific Evaluation: The site-specific evaluation consists of a comparison of sample-specific detected results against site-specific ecological preliminary remedial goals (EcoPRGs) developed for avian and mammalian receptors that may potentially be found at the sites. Chemicals with observed concentrations exceeding the EcoPRGs are carried forward to Step 4 (Weight of Evidence Evaluation).
- Step 4 – Weight of Evidence Evaluation: The weight of evidence evaluates multiple lines of qualitative and quantitative evidence to place the potential risks into context of site-specific conditions. These lines of evidence include the results from Steps 1 through 3, comparisons to regional background concentrations, potential for ecological receptors to use the site, available habitat, and expected future use of the site. The results of the weight of evidence evaluation are used to inform risk managers of chemicals considered to pose a potential risk to ecological receptors so that remedial decisions can be made for the site.

The streamlined ERAs were conducted under the following assumptions and constraints. These are typical for ERAs performed for both public and private entities:

- Evaluation of current exposures is derived from existing conditions.
- The abiotic medium of primary ecological concern is soil.

- Measured chemical concentrations are assumed to be at steady-state levels.
- Chemicals never detected or not analyzed for in soil samples are not evaluated.
- Each chemical measured in collected samples is considered to have similar bioavailability as the chemical form used in the toxicity studies that are used to estimate potential for risk.
- Toxicological information used represents information currently available from literature and database searches.

2.2 Cleanup Goals

As described above and in the California SI Report (Jacobs 2023b), results of the HHRA and ESAs were used to make risk management decisions. For sites where the risk was determined to be unacceptable, PacifiCorp has chosen to remove the impacted soil (Figure 2-1).

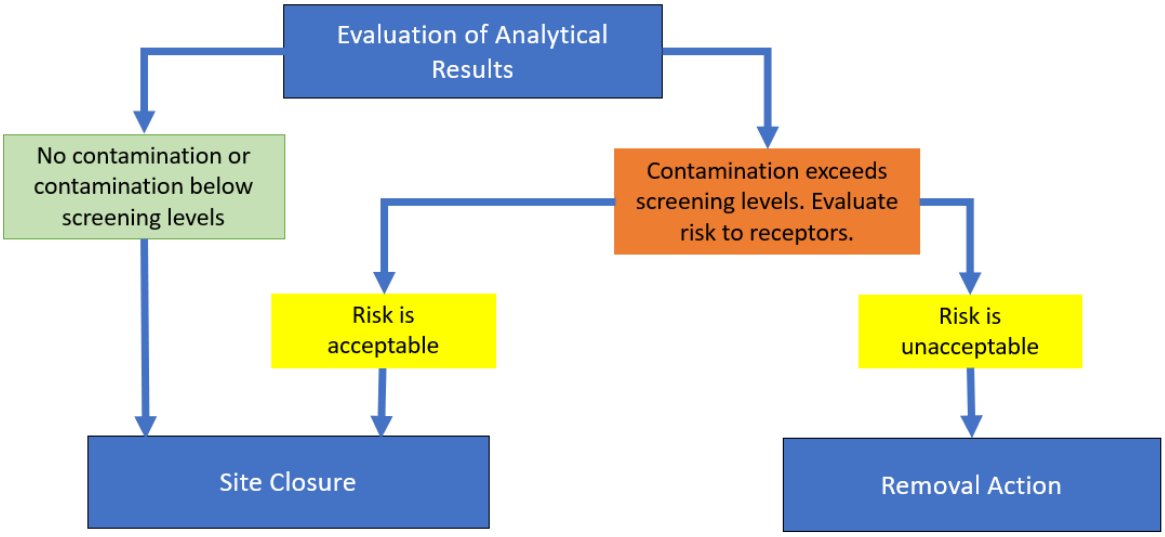

Figure 2-1. Flowchart of Possible Next Steps

Six sites have COCs retained from the risk assessment. The cleanup goals are the risk-based concentrations for human health and leaching to groundwater as presented in the California SI Report (Jacobs 2023b), except for arsenic where background concentration is used for the cleanup goal (Table 2-1).

Subsequent sections of this California RAP describe the approach to ensuring that the removal action objectives are met for each site.

Table 2-1. Cleanup Goals for Constituents of Concern

Site/REC	Constituents of Concern after Risk Assessments	Cleanup Goals
Copco No. 2 Wood-Stave Penstock	PCP and PAHs (benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene)	PCP: 1.5 mg/kg (leaching) BaP: 0.11 mg/kg (HH) BbF: 1.1 mg/kg (HH) DahA: 0.028 mg/kg (HH)
Copco No. 2 Wood Pile	PCP	PCP: 0.098 mg/kg (leaching)
Copco No. 2 Powerhouse Transformer Fire	DRO, PCB (Aroclor 1262) and PAHs (benzo(a)pyrene, dibenzo(a,h)anthracene)	DRO: 960 mg/kg (HH) BaP: 0.11 mg/kg (HH) DahA: 0.028 mg/kg (HH) Aroclor 1262: 0.24 mg/kg (HH)
Copco No. 2 Burn Pit - Backhoe	DRO	DRO: 960 mg/kg (HH)
Copco No. 2 Burn Pit - Burn Pit	Dioxin (2,3,7,8-TCDD), naphthalene	2,3,7,8-TCDD TEQ: 4.8E-6 mg/kg (HH) Naphthalene: 0.042 mg/kg (leaching)
Copco No. 2 Burn Pit - Concrete Rubble	PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, Indeno(1,2,3-cd)pyrene)	BaA: 1.1 mg/kg (HH) BaP: 0.11 mg/kg (HH) BbF: 1.1 mg/kg (HH) DahA: 0.028 mg/kg (HH) Indeno(1,2,3-cd)pyrene: 1.1 mg/kg (HH)
Iron Gate Shooting Range	Lead	Lead: 80 mg/kg (HH)
Iron Gate Hatchery Burn Pit	Arsenic	Arsenic: 19 mg/kg (background)

Notes:

BaA = benzo(a)anthracene

BaP = benzo(a)pyrene

BbF = benzo(b)fluoranthene

DahA = dibenzo(a,h)anthracene

DRO = diesel range organics

HH = human health

IcdP = indeno(1,2,3-cd)pyrene

mg/kg = milligrams per kilogram

PAHs = polyaromatic hydrocarbons

PCB = polychlorinated biphenyl

PCP = pentachlorophenol

REC = recognized environmental concern

3. Implementation Plan

This section presents the general plan for addressing impacted shallow soil at the various sites. Site-specific removal activities are detailed in Sections 4 through 9.

3.1 Removal Action Work Plan

This subsection outlines the typical administrative controls, permit requirements, and sequence of work for removal (i.e., excavation) activities at the various sites.

3.1.1 Site Security and Access

During all removal activities, access will be restricted to authorized personnel only. Contractors will follow the site access and sign-in procedures established by KRRC or their representative.

3.1.2 Traffic Control

As necessary, traffic management will be implemented to manage the safe entry and exit of vehicles from the site. Equipment and personnel will be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas. Upland routes covered with pavement, bare ground, or non-native vegetation will be utilized as access routes to and from the excavation sites to the maximum extent practicable.

3.1.3 Cultural Resources

Cultural resources are known to exist in the vicinity of the three dam developments and surrounding lands. As part of the original site investigations and prior to any field activities, AECOM conducted a review of potential effects on historic and archaeological resources at each proposed sampling site (AECOM 2022a, 2022b). The goal was to ensure that soil sampling and cleanup activities do not adversely affect National Register of Historic Places-eligible archaeological or historic resources. The AECOM review recommended that archaeological monitoring be provided during soil sampling at six sites in California. Archaeological monitoring was performed by Jacobs when implementing the California SIWP at those six sites. Only three of those sites have been brought forward for cleanup. Therefore, archaeological monitoring will again be performed by Jacobs when implementing this California RAP at the following sites:

- Copco No. 2 Wood-Stave Penstock
- Copco No. 2 Wood Pile
- Iron Gate Hatchery Burn Pit

Should cultural monitoring result in the inadvertent discovery of culturally sensitive resources, the Jacobs team will notify the KRRC's cultural resources team.

3.1.4 Biological Resources

The following biological avoidance, minimization, and mitigation measures will be implemented for the protection of special-status species that may be present on or near the site during field activities:

- A preconstruction biological assessment will be completed by a qualified biologist to review potential effects on biological resources before removing debris and implementing the soil removal actions at each site. This will include removal areas, staging and laydown areas, and undeveloped access routes.

- All field team members, including the removal contractor and lower-tier subcontractors, will complete the online KRRC Biological Resource Training program as part of premobilization activities.
- A preconstruction nesting survey will be completed by a qualified biologist for sites with remedial activities planned to occur during the nesting season (February 1 – August 31). If nesting birds are found during surveys, the California Department of Fish and Wildlife (CDFW) will be notified, and no Project activity will occur within 250 feet for raptors and 100 feet for other nonlisted birds until a site-specific mitigation and monitoring plan has been developed (including reporting requirements) and agreed upon with CDFW.

3.1.5 Permit Requirements

Necessary permits and notifications for removal activities, transportation, stormwater control, and air quality (including notifications to Siskiyou County, if needed) will be obtained prior to the start of removal activities. Copies of the permits will be onsite and will be made available for inspection during working hours. The anticipated permits will include the following components, at a minimum:

- A courtesy copy of the California RAP will be provided to Siskiyou County Environmental Health prior to execution of the work. Additionally, a courtesy copy of the Soil Removal Action Completion Report (described in Section 3.2) will be provided to Siskiyou County at the completion of the Project.
- Dust control management measures and lead exposure monitoring will be implemented. Section 3.1.13 provides additional information regarding compliance with these rules.
- A stormwater pollution prevention plan (SWPPP) will be prepared to meet the requirements of the California General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (CGP). A Notice of Intent and Permit Registration Document will be submitted and CGP permit requirements will be implemented.

3.1.6 Mobilization and Site Preparation

Mobilization activities will include the delivery and setup of equipment, materials, and tools required to perform the soil removal actions at the various sites. Resources necessary to excavate soil and perform soil removal activities will be mobilized; these resources include personnel and all subcontractors, equipment, materials, supplies, and support facilities. The support facilities will include a secure material and equipment storage area and any other facilities needed to support work activities.

Site preparation activities will include: 1) establishing work zones; 2) implementing stormwater best management practices (BMPs) as required by the CGP; 3) defining baseline topography and excavation areas by a licensed surveyor; and 4) clearing and grubbing of surface vegetation in the defined excavation area.

Underground Service Alert will be notified at least 48 hours before field activities commence to mark subsurface utilities within and surrounding the planned work areas. A third-party utility locator service provider will also be utilized to identify utilities within and surrounding the planned work area. Field maps showing the results of the utility survey will be completed in the field. If any utilities are identified during the survey, they will be identified on the ground by spray painting along the utility centerline. The field markings will be color-coded to identify the type of utility according to the American Public Works Association uniform color code.

Topographical surveying was not completed at the sites. As part of site preparation activities, topographical base maps will be developed for the excavations. The base maps will be developed by a surveyor licensed in the State of California. The baseline surveys will be used in conjunction with progress and as-built surveys to determine the volumes of soil removed from each excavation site.

Jacobs, in consultation with PacifiCorp and KRRC, will also designate an area for establishing a secure central storage and equipment laydown yard. If needed, additional temporary laydown or stockpile areas will be identified for each site. The storage and laydown areas will be secured with temporary fencing.

Project mobilization will additionally include:

- Confirming that all applicable and necessary permits have been secured (Section 3.1.5).
- Setting up temporary facilities and utilities, such as portable toilets and hand and eye washing stations.
- Identifying and clearly demarcating work zones, including the exclusion, decontamination, and support zones, at each site. The exclusion zone will include all areas of excavation, contaminated soil staging areas, and the truck loading area. The decontamination zone will be used for decontaminating personnel, equipment, and vehicles prior to exiting the site. The support zone will be used to temporarily store equipment, vehicles, and clean soil and to accommodate Project personnel.
- Identifying and clearly marking contaminated soil staging areas, if needed.
- Preparing the decontamination area in a designated area approved by the construction manager.
- Establishing traffic routes from the work zones to the decontamination areas to minimize the spread of potentially impacted soils.
- Positioning all health and safety equipment and supplies for use, if needed.

3.1.7 Equipment

The excavation contractor will determine the equipment needed on a case-by-case basis for each site. The required equipment will depend on actual site conditions and access needs. A list of possible equipment is as follows:

- Front end loaders
- Bulldozers
- Hydraulic excavators (i.e., backhoes)
- Water truck
- Dump trucks
- Temporary fencing
- Other equipment, based on field needs.

Equipment and personnel will be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas.

3.1.8 General Excavation Procedure

Site-specific initial excavation volumes have been estimated based on the data collected in the California SI Report (Table 3-1). Excavation will be conducted in the following general sequence:

1) Staging and access paths will be developed for equipment to be used during the soil removal process. Roads will be maintained, and tire decontamination will be implemented to prevent offsite tracking.
2) Underground utility clearances will be conducted by means of the local one call service and a private utility location contractor, as necessary.
3) The construction manager will identify appropriate locations for fugitive dust monitoring and arrange for monitoring that complies with health and safety requirements.
4) Excavation offset stakes will be used to mark the planned limits of excavation.

5) Designated areas will be excavated to a predetermined depth.
6) Excavated soil will primarily be loaded directly into haul trucks. At the contractor's option, soil may be stockpiled at a designated stockpile location (Section 3.1.6).
7) Excavation operations will be managed following the BMPs described in the Project-specific SWPPP.
8) To prevent unauthorized access, a temporary 6-foot-high fence will be installed around an open excavation until the excavation is backfilled.
9) Excavated soil will be loaded into trucks and will be properly manifested, truck tires will be decontaminated, and dirt clods will be removed from exterior surfaces such as frame rails.
10) Soil will be transported offsite for disposal at an approved and permitted facility.
11) Post-excavation confirmation soil samples will be collected (Section 3.1.20) to determine whether cleanup goals have been achieved (Section 2.2).

Table 3-1. Site-Specific Initial Excavation Volumes

Site/REC	Approximate Aerial Extent of Excavation (square feet)	Approximate Depth of Excavation (feet)	Approximate Bank Volume to be Excavated (cubic yards)	No. Confirmation Sidewall Sample Locations	No. Confirmation Floor Sample Locations
Copco No. 2 Wood-Stave Penstock	50,000	1 (also five subareas to 3, 4, and 4.5 feet)	1,852	71	25
Copco No. 2 Wood Pile No. 2	1,500 (25- by 60-foot)	6	333	6 (3 sample intervals)	2
Copco No. 2 Powerhouse Transformer C Fire	200 (10- by 20-foot)	2	15	4	1
Copco No. 2 Burn Pit - Backhoe Parking Area	640 (20- by 32-foot)	1	24	8	2
Copco No. 2 Burn Pit - Burn Pit	1,520 (38- by 40-foot)	4	225	8 (2 sample intervals)	2
Copco No. 2 Burn Pit - Concrete Rubble Area	156 (12- by 13-foot)	1	6	4	1
Iron Gate Shooting Range – Long Range Target	8,250 (75- by 110-foot)	2	611	14	12
Iron Gate Shooting Range – Short Range Target & Berm	2,500 (50- by 50-foot)	1	114	10	10
Iron Gate Hatchery Burn Pit	1,155 (33- by 35-foot)	0.5	21	4	1
	Total No. Initial Confirmation Soil Samples			**129**	**56**

3.1.9 Excavation Sloping

Occupational Safety and Health Administration Regulations, Title 29 *Code of Federal Regulations* 1926, Subpart P, and *California Code of Regulations* Title 8, Section 5192 that govern safety and health regulations for construction will be adhered to and enforced during the soil removal action.

3.1.10 Waste Handling and Disposal

Waste soil (investigation-derived waste) generated from each of the sites during the site investigation was determined to be nonhazardous and was disposed of accordingly (Jacobs 2023b). It is currently assumed that the excavated soil will be managed under the waste profiles generated during the site investigations performed in 2022. Where additional data are needed to characterize soils, the site investigation will be used as a starting point for waste profiling.

When possible, waste soil from the excavations will be direct loaded into haul trucks for offsite disposal. For sequencing reasons, stockpiling of waste soil may be necessary. Waste soil stockpiles will be constructed and managed using BMPs identified in the SWPPP. It is currently assumed that wastewater will be primarily generated from decontamination of sampling equipment and that such waste will be managed under the waste profiles generated during the site investigations performed in 2022.

Soil to be disposed of offsite will be transported via haul trucks to an approved disposal facility. Prior to transportation of contaminated materials, a soil data and certification sheet will be completed as part of the waste acceptance requirement.

Personal protection equipment (e.g., latex gloves) will be identified in the waste profile for soil and will be disposed of with waste soil. General construction debris and municipal waste will be disposed of as general waste at a municipal landfill.

3.1.11 Transportation Plan

Nonhazardous impacted soil that is disposed of offsite will be transported to an appropriate disposal facility. Appropriate licensed and permitted disposal facilities may include:

- Waste Management, Hillsboro Landfill, 3205 SE Minter Bridge Road, Hillsboro, Oregon
- Oil Re-Refining Company (Orrco) – Portland Facility, 4150 N. Suttle Rd., Portland, Oregon

Hazardous impacted soil identified for offsite disposal will be transported under a hazardous waste manifest with a PacifiCorp EPA Identification Number to an appropriate disposal facility. Appropriate licensed and permitted disposal facilities may include:

- Waste Management, Kettleman Hills Facility, 35251 Old, Skyline Road, Kettleman City, California
- U.S. Ecology Nevada Inc., Highway 95 S, Beatty, Nevada

All transportation activities will be performed in strict compliance with applicable regulations and ordinances. The hauling contractor(s) used to transport contaminated waste will be fully licensed, bonded, and permitted by EPA and the State of California. Department of Transportation and California Highway Patrol safety regulations will be followed.

Transportation equipment will be chosen to safely transport the expected volumes of soil, taking into consideration the types of roads to be traveled and their loading capacity. Trucks will use only preplanned and authorized routes. A detailed log of the loads hauled from the site will be maintained. The waste will be off-loaded for treatment or disposal in a manner consistent with current federal, state, and local regulations.

To minimize the need to decontaminate the truck tires, the construction manager will direct the haul trucks so that they remain on clean areas to the extent possible. During loading, dust emissions will be monitored by the construction manager and mitigated, if necessary, by the excavation contractor. The transportation and disposal contractor will ensure that the hauling trucks will be equipped to fully cover and contain all soil and debris during transportation, thereby preventing spillage or dust emissions.

3.1.12 Spill Prevention and Response Plan

A Spill Prevention and Response Plan will be prepared for responding to and handling onsite spills. All contractors will adhere to the provisions of the Spill Prevention and Response Plan to ensure continued protection of the public safety and the environment.

3.1.13 Fugitive Dust Monitoring

Dust control management measures, including water spraying, will be implemented during soil removal and excavation activities. Only nonpotable water is expected to be used for dust control. The use of dust suppression amendments (Simple Green, Envirotech Vapor Suppressant, or equivalent) will be evaluated on a case-by-case basis prior to use if water alone is not adequate.

For removal of soil at the Iron Gate Shooting Range, specific procedures will be included in the Health and Safety Plan (described in Section 3.1.17) to address lead-containing soils. These procedures will include personal air monitoring and work area boundary monitoring.

3.1.14 Decontamination Procedures

To prevent the unintentional offsite transfer of impacted soil or the spreading of residual impacted soil onsite by construction equipment and personnel, the following decontamination procedures will be implemented:

- The equipment decontamination area will be located in the designated upland staging area away from drainages.
- All equipment wheels/tires will be cleaned over gravel track out pads by appropriate methods.
- Personal protective equipment, such as disposable coveralls and booties, will be removed and stored in the contamination reduction zone.
- All personal protective equipment will be disposed of as discussed in Section 3.1.10.

3.1.15 Stormwater Management Plan

A SWPPP will be prepared prior to construction activities and will be implemented throughout the Project duration. BMPs will be inspected and maintained as needed. SWPPP recordkeeping will be implemented throughout the Project duration.

3.1.16 Supplemental Environmental Controls

Other environmental controls may be required in the event that anticipated conditions at the site change. The soil removal actions will be conducted in a manner that will adapt to changing conditions, with appropriate mitigation measures to be developed as needed.

3.1.17 Health and Safety Plan

A Health and Safety Plan will be prepared by Jacobs to address procedures and potential hazards associated with the proposed soil removal action activities. The Jacobs Health and Safety Plan will be prepared to provide pertinent information concerning COPCs, levels of personnel protection, personal protective equipment upgrade action criteria for air monitoring results, monitoring equipment, and physical hazards and safeguards associated with the anticipated field activities. In the event that unanticipated conditions occur, the Jacobs Health and Safety Plan will be modified appropriately.

3.1.18 Contingency Planning

Contingency planning traditionally addresses elements of an action that could not go as planned during project implementation. Should such an event occur, the contingency plan is implemented to deal with the situations. For this California RAP, PacifiCorp has identified several potential elements that could create complications for the cleanup work (Table 3-2). The relative probability of occurrence for each element has not been evaluated; however, PacifiCorp's ongoing coordination with the KRRC team in planning the work reduces the likelihood of some of the more controllable elements occurring (Table 3-2). Somewhat controllable elements related directly to the work include, for example, staffing and landfill issues. The relative risk of elements related to the work should be reduced by coordination and communication among the Project team, with the KRRC, and with other stakeholders, as necessary. Other elements are related to climate or emergency situations (for example, weather and wildfire) and are less controllable but can still be planned for with contingency measures.

Table 3-2. Contingency Planning for Work Associated with Cleanup of Project Sites

Element	Contingency Plan
Contractor or subcontractor equipment or staffing availability	PacifiCorp has been working closely with the contractor to ensure they have the resources available to complete the work. Should that become an issue, additional subcontractors may be brought onto the Project to ensure timely completion of the work.
Injuries or accidents	Any personnel injury, accident, or damage to equipment during the execution of the work will be handled in accordance with the Jacobs Project-specific Health and Safety Plan.
Spill containment and response	Should there be an inadvertent spill or release, the Project-specific Spill Prevention and Response Plan will be followed for initial containment, stabilization, and notification of the KRRC and appropriate state and/or federal agencies.
Changes in waste disposal landfill restrictions	Waste characterization has been conducted as part of the California SI Report. PacifiCorp will likely be collecting new or additional waste characterization samples for review and acceptance by the designated landfills. Additionally, samples will be collected from the Iron Gate Shooting Range to complete waste characterization for this site. In a worst-case scenario, spoils may need to be stockpiled while characterization process and acceptance by the landfill is complete.
Confirmation samples exceeding ESLs	If confirmation samples exceed the target ESLs for a given site and contaminant, PacifiCorp will return to the site, excavate additional soil, and repeat the confirmation sampling per the pattern described in the California RAP. This is an iterative process that could require multiple excavations and testing if contamination is more widely distributed than was indicated in the California SI Report.

Table 3-2. Contingency Planning for Work Associated with Cleanup of Project Sites

Element	Contingency Plan
Discovery of COCs different than what has been documented at a site	The discovery of contaminants present at levels not identified in the California SI Report could result in the recharacterization of waste, changes in disposal methods, or the need for other handling requirements. Any shift in observed subsurface conditions during excavation that could be linked to contamination should result in a stoppage of work so additional investigation can occur. This investigation could lead to changes in the extent of excavation, materials handling, personal protective equipment requirements, or disposal locations.
Access to a Project site is restricted by KRRC work	PacifiCorp is coordinating the work described in this California RAP with the KRRC; however, it is possible that the KRRC's schedule of work changes such that access to a specific location is not possible. In such a case, the contractor will have the flexibility to adjust their schedule and work at other locations until access to an area is available. In a worst-case scenario, the contractor may have to remobilize if there is not another available work location and the site will be inaccessible for an extended period of time.
Wildfire forces evacuation of the area or wildfire smoke creates unsafe work conditions	Safety of PacifiCorp's staff and contractors is of paramount importance. Wildfire-forced evacuations or wildfire smoke that prevents the safe continuation of work are scenarios that have recently occurred in the area and could occur at any time during the work. These are situations for which contingency planning is limited to evacuation routes and appropriate personal protective equipment. In both situations, the contractor will remobilize staff to the site when conditions are safe for continued work. In these cases, schedule delays are likely to be unavoidable.
Discovery of previously undiscovered or unknown contaminants	The approach to managing and addressing the discovery of previously unknown areas of contamination or contaminants is addressed in Section 2.5 of the *California Site Investigation Work Plan Supplement No. 1* (Jacobs 2023a).
Adverse weather (heat/cold)	The work areas on the Lower Klamath Project could be subject to extreme temperatures (either hot or cold) that shorten the available amount of time the contractor can work or otherwise create an unsafe working condition. The contractor will comply with all regulations regarding work periods as related to temperature. Adjustments to start times (for example, earlier in the day to avoid heat) could help minimize delays associated with uncontrollable climatic events.
Adverse weather (rainfall)	Precipitation itself is not typically an element that would challenge the Project. However, some of the sites are not easily accessible if the soils become saturated. This could be an issue if the work is delayed into the winter or areas are subject to extreme thunderstorms. In such cases, the contractor will either have to shift work to another accessible area or simply wait for ground conditions to improve. Any stockpiles and work sites would need to be actively managed during this period in accordance with the requirements of the SWPPP to ensure they remain stable and do not erode into the surrounding areas.

Table 3-2. Contingency Planning for Work Associated with Cleanup of Project Sites

Element	Contingency Plan
Discovery of cultural resources or human remains	Inadvertent discovery of cultural resources or human remains could result in a delay of excavation while the discovery is evaluated, the appropriate agencies and tribes are consulted, and permission to proceed with work is obtained. This risk has been minimized through prescreening of the work sites. A Jacobs cultural resources monitor will be present at those locations where it is possible to encounter resources or remains and PacifiCorp's Inadvertent Discovery Plan will be followed for all work areas. Coordination with the KRRC's cultural resources team onsite could also help minimize the risk of delay if resources or remains are discovered. If a discovery does occur, the contractor may need to move to a different work area while the significance of a find is addressed and approvals to move forward are obtained.
Potential Claims	Any incident that could lead to a claim affecting KRRC should be promptly reported to KRRC with appropriate reports to follow.

3.1.19 Site Coordination Plan

PacifiCorp recognizes that the areas around Copco, Iron Gate, and J.C. Boyle are active construction sites and as such, careful coordination with the KRRC is required. This coordination has already started and will continue as the contractor mobilization date approaches. The Site Coordination Plan calls for pre-activity meetings between PacifiCorp and the KRRC. The purpose of the meetings is to identify contractor laydown, staging areas, and stockpile locations, set work-hour restrictions, define secured access and badging requirements, and establish scheduling constraints. To date, two pre-activity coordination meetings have been held, the first on June 26, 2023, and the second on July 12, 2023.

During fieldwork execution, the key point of contact between PacifiCorp and the KRRC will be PacifiCorp's Representative (PacifiCorp Rep). At a minimum, the PacifiCorp Rep will communicate the planned work, site location(s), access, and haul routes to the KRRC team during daily meetings. At the daily meetings, any issues raised by the KRRC team will either be addressed directly by the PacifiCorp Rep or will result in a specific follow-up meeting. Specific coordination meetings or site visits for select sites may be required. Those additional coordination meetings or site visits will be scheduled on a case-by-case basis.

In the event of an unforeseen situation that is caused by or creates an emergency situation, the contractor and onsite PacifiCorp Rep would communicate with emergency services, PacifiCorp management, and the KRRC as appropriate. Depending on the situation, a call to 9-1-1 to activate emergency responders would occur first, followed by a call to PacifiCorp's Hydro Control Center, the PacifiCorp Project Manager, and the contractor's own management team. The calls to the Hydro Control Center and PacifiCorp's Project Manager would lead to follow-up calls to others on the PacifiCorp team as appropriate (e.g., compliance, operations, safety, or management staff) and the KRRC.

3.1.20 Confirmation Soil Sampling

In general, confirmation soil samples will be collected from the floor of the excavation and from each excavation sidewall. If bedrock is observed within an excavation floor or sidewall, excavation work will be terminated and a confirmation soil sample will be collected, if appropriate. One confirmation soil sample will be collected from each 750-square-foot section of excavation floor and one confirmation soil sample will be collected from each 25-foot linear section of sidewall. At the sidewall locations, one representative

soil sample will be collected from each 2-foot interval (i.e., 0- to 2-foot, 2- to 4-foot, and 4- to 6-foot intervals). At each REC, additional equally spaced confirmation samples may be collected to ensure that each site has an adequate number of samples available to calculate the site-specific EPC.

Confirmation soil samples will be collected in 4- or 8-ounce glass jars and from the bucket of the excavator/backhoe if the excavation depth exceeds 4 feet below ground surface (bgs). When it is safe to enter excavations shallower than 4 feet bgs, confirmation soil samples will be collected directly into glass jars or by using a decontaminated metal or disposable trowel. Confirmation soil samples for volatile organic compound (VOC) analysis will be collected as per the existing and approved Sampling and Analysis Plan (SAP) (see Appendix A of the SIWP; Jacobs 2021a).

Hand-held soil sampling equipment will be decontaminated prior to the collection of each confirmation soil sample. Prior to sampling, any loose material or soil will be gently brushed off the surface of the excavation, and care will be taken to collect the sample from an undisturbed area.

Confirmation soil samples will be analyzed for the COCs at each site (Table 2-1). The laboratory analyses will be performed using the analytical methods and detection limits specified in the SAP (see Appendix A of the SIWP; Jacobs 2021a). The analytical data provided by the analytical laboratory (accredited under the California Environmental Laboratory Accreditation Program) will undergo quality control checks for useability, then uploaded to a database for use in the analysis and reporting process.

The analytical results for the confirmation samples will be compared to the cleanup goals (Table 2-1) for decision making as follows (Figure 3-1):

- If all samples are below the COC cleanup goals, no further excavation is required.
- If the calculated sitewide COC EPCs (see Section 2.1.1) are below the cleanup goals, no further excavation is required.
- If there are multiple or substantial exceedances, additional excavation may be required.

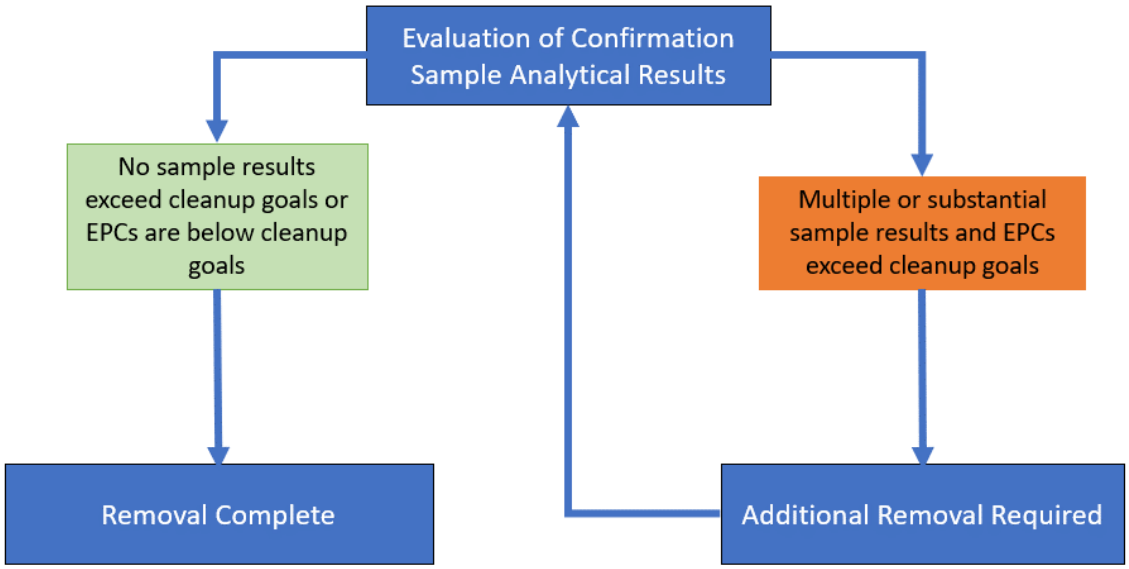

Figure 3-1. Confirmation Sampling Evaluation

Multiple or substantial exceedances will result in deepening and expanding of the excavation. In general, it is anticipated that excavations will be iteratively deepened and expanded in 0.5- to 1-foot increments, or observation of bedrock. Upon expanding the excavation, one step-out confirmation soil sample will be collected for every 750 square feet of newly exposed excavation floor and for every 25 linear feet of newly exposed sidewall. When multiple COCs are detected at concentrations greater than cleanup goals, cumulative effects will be estimated by summing the ratios of the concentration to cleanup goal for carcinogenic and noncarcinogenic COCs (i.e., the sum of the ratios exceeds 1) to determine if additional soil removal is required.

3.1.21 Backfilling and Site Restoration

PacifiCorp has made initial inquiries to KRRC regarding sourcing of clean backfill soil from onsite construction work associated with dam removal. The intent is to use available soil from ongoing dam-removal work to backfill site excavations resulting from soil removal actions.

Prior to use of this backfill material, these stockpiles will be tested to confirm that constituent concentrations are appropriate for use as clean backfill for the REC excavations.

For stockpiles of less than 1,000 cubic yards, one sample will be collected for every 250 cubic yards. For stockpiles of 1,000 cubic yards or more, four samples will be collected for the first 1,000 cubic yards, and one additional sample will be collected for every additional 500 cubic yards. For example, one sample would be collected from a 100-cubic-yard stockpile, two samples would be collected from a 500-cubic-yard stockpile, and five samples would be collected from a 1,500-cubic-yard stockpile.

Sampling locations will be determined by dividing the length of the stockpile by the number of required samples and creating sampling areas of equal area. One sample will be collected from each area of the stockpile from the side. Each sample will be collected on the opposite side of the pile from any neighboring samples. Sample labeling, handling, analytical methods, quality assurance/quality control procedures, and database entry requirements will follow the same procedures as the California SIWP (Jacobs 2021a).

The analytes and frequency will be selected in general accordance with DTSC guidance. The following analytical methods are anticipated, depending on the fill source:

- PAHs (U.S. Environmental Protection Agency [EPA] Method 8270)
- Total petroleum hydrocarbon (TPH)-extractable (EPA Method 8015M)
- Title 22 Metals (EPA Method 6010)

Anticipated procedures for soil backfill placement and compaction are as follows:

- The soil at the bottom of the excavation area will be compacted to the same requirements as the fill that will be placed above it. Excavations will be free of standing water or loose or disturbed materials before placing any fill.
- Fill material will be placed in maximum 8-inch loose lifts and compacted to not less than 90 percent relative compaction per standard Proctor (ASTM D698), unless otherwise specified. Compaction levels will be verified.
- Backfilled areas will be graded to the appropriate subgrade required for surface restoration. The subgrade will be graded to facilitate proper drainage at the site after the surface is restored.
- If required, topsoil will be placed over backfilled areas and prepared for seeding. A commercially available native seed mix will be used for site restoration.

After backfilling, topsoil placement, and seeding have been completed, construction waste and temporary BMPs will be removed.

3.2 Removal Action Completion Report

Once the soil removal action is complete and the necessary confirmation sampling results have been reviewed and validated, a Soil Removal Action Completion Report will be prepared to document the soil removal activities that were performed. The report will include:

- A narrative describing the work performed at each site, including an explanation of unexpected findings and required deviations from the original plan.
- Analytical results from confirmation samples.
- Detailed maps of the location and extent of the soil removal activities.
- Documentation of soil excavated and removed from the sites, including final disposition of excavated soil, and documentation of the amount and source of backfill material.
- Copies of necessary permits.
- Annotated photo documentation of the remediation fieldwork.
- Official correspondence, governmental sign-offs, closure letters received from federal, state, and local agencies, or similar communications to be included as an appendix to the report.

4. Copco No. 2 Wood-Stave Penstock

This section summarizes the background and site-specific removal activities for the Copco No. 2 Wood-Stave Penstock (penstock). Detailed descriptions of the site background and of the risk assessment results determined upon evaluation of the analytical results from the site assessment are respectively provided in the California SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this California RAP by reference.

4.1 Background

The penstock was identified as a REC based on Phase II ESA (AECOM 2020b) soil sampling results that indicated the presence of arsenic and lead at concentrations above background for the Cascade Range based on Oregon Department of Environmental Quality (ODEQ) guidance (ODEQ 2013) and the presence of various semivolatile organic compounds (SVOCs) (anthracene, benzo[a]anthracene, benzo[b]fluoranthene, carbazole, chrysene. Creosote, fluoranthene, indeno[1,2,3-cd]pyrene, pentachlorophenol, phenanthrene) likely from the treated wood (AECOM 2020b).

Per the California SI Report, pentachlorophenol and various polynuclear aromatic hydrocarbon (PAHs) [i.e., benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene] were identified as present in concentrations above acceptable human health risk levels at this site. Concentrations of pentachlorophenol in site soil also exceed soil leaching screening levels protective of nondrinking water resources. Consequently, soil from beneath Copco No. 2 Wood-Stave Penstock was recommended for excavation and offsite disposal. Soil removal activities will not address accumulated water from beneath the penstock because:

- The accumulated water will not be present after the penstock is dewatered and removed.
- The HHRA demonstrated that the shallow water below the penstock does not pose an unacceptable risk to construction workers.
- The accumulated water beneath the penstock, is not considered potable water source.

4.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at the penstock with the understanding that boulders, bedrock, or both, may limit the vertical and lateral extents of the excavation:

- Excavate an approximate 50,000-square-foot area to a minimum depth of 1 foot bgs or refusal (Figure 4-1).
- Based on an evaluation of analytical and risk assessment data from former soil borings C2WS-05, C2WS-06, and C2WS-16 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Locations 2, 3, and 5 to a depth of 3 feet bgs or refusal (Figure 4-1).
- Based on an evaluation of analytical and risk assessment data from former soil boring C2WS-15 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Location 4 to a depth of 4 feet bgs or refusal (Figure 4-1).
- Based on an evaluation of analytical and risk assessment data from former soil boring C2WS-13 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Location 1 to a depth of 4.5 feet bgs or refusal (Figure 4-1).
- Where the initial excavation depth is 1 foot bgs, collect confirmation soil samples along the northern and southern sidewalls. The sidewall samples will be spaced approximately 50 feet apart and will

represent soil from ground surface to the bottom of the excavation. Also collect confirmation soil samples from the excavation floor. The floor samples will be spaced approximately 50 feet apart (Figure 4-1; Table 4-1).

- Where the initial excavation depths are 3, 4, or 4.5 feet bgs, collect one confirmation soil sample from the excavation floor.
- Where the initial excavation depths are 3, 4, or 4.5 feet bgs, collect confirmation soil samples from each excavation sidewall. Collect two soil samples from the respective northern and southern sidewalls of these deeper excavation areas. One sidewall sample will represent soil from ground surface to the midpoint of the excavation, and one sidewall sample will represent soil from the midpoint to the bottom of the excavation. Soil samples from the eastern and western sidewalls will represent soil from 1 foot bgs to the bottom of the excavation.
- Analyze the soil samples for pentachlorophenol and the following PAHs: benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene (Table 4-1).
- Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.

5. Copco No. 2 Wood Pile No. 2

This section summarizes the background and site-specific removal activities for the Copco No. 2 Wood Pile No. 2 (Wood Pile No. 2). Detailed descriptions of the site background and of the risk assessment results determined upon evaluation of the analytical results from the site assessment are respectively provided in the California SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this California RAP by reference.

5.1 Background

The *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020a) identified three utility pole stockpiles approximately three-quarters of a mile northeast of the intersection of Copco Road and Daggett Road. The utility poles were stockpiled because they had been removed from service and have subsequently been removed from the site and disposed of in an appropriate manner by PacifiCorp.

Per the California SI Report, a data gap caused uncertainty in the HHRA because pentachlorophenol was not vertically or laterally delineated in soil beneath Wood Pile No. 2. Consequently, soil from beneath Wood Pile No. 2 was recommended for excavation and offsite disposal.

5.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at Wood Pile No. 2:

- Excavate an approximate 25- by 60-foot area to a depth of 6 feet bgs or refusal (Figure 5-1).
- Collect one confirmation soil sample along the eastern and western sidewalls and collect two confirmation soil samples along the northern and southern sidewalls.
- Collect two confirmation soil samples from the excavation floor.
- Collect three confirmation soil samples at each sidewall sample location. The sidewall soil samples will represent soil from ground surface to a depth of 2 feet bgs, from 2 to 4 feet bgs, and from 4 to 6 feet bgs (Table 5-1).
- Analyze the soil samples to confirm that pentachlorophenol is no longer present at concentrations greater than the associated cleanup goals (Table 2-1).
- Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.

6. Copco No. 2 Powerhouse Transformer C Fire

This section summarizes the background and site-specific removal activities for the Copco No. 2 Powerhouse Transformer C Fire. Detailed descriptions of the site background and of the risk assessment results determined upon evaluation of analytical results from the site assessment are respectively provided in the California SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this California RAP by reference.

6.1 Background

In May 2006, the aboveground Transformer C located in front of the south side of the Copco No. 2 Powerhouse caught fire, resulting in a release of approximately 715 gallons of transformer oil to the gravel catch basin and surrounding area. Soil in the immediate vicinity of the site was assessed in July 2006 (Parametrix 2006), and the soil sampling results were submitted to the Siskiyou County Department of Public Health by PacifiCorp (PacifiCorp 2006). The Siskiyou County Department of Public Health stated in a follow-up letter to PacifiCorp on September 21, 2006, that no further site investigation was required and that the Department concurred with PacifiCorp's plan to assess soil beneath the transformers when they were dismantled and to characterize the site soils for proper disposal (PacifiCorp 2006). Because there are no records confirming removal of total petroleum hydrocarbon (TPH)-impacted soil when the transformers were dismantled, PacifiCorp decided to collect soil samples as outlined in the California SIWP (Jacobs 2021a).

Per the California SI Report, diesel range organics (DRO) were identified as present in concentrations above acceptable risk levels for human health and leaching to groundwater. Also identified in concentrations above acceptable human health risk levels were various PAHs (i.e., benzo(a)pyrene and dibenzo(a,h)anthracene) and polychlorinated biphenyls (PCBs) (i.e., Aroclor 1262) in soil near the southeast corner of the Powerhouse (Figure 6-1). Consequently, soil removal with offsite disposal was recommended for this area.

6.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at the Copco No. 2 Transformer C Fire site after the Copco No. 2 Powerhouse utilities have been de-energized:

- Excavate an approximate 10- by 20-foot area to a depth of 2 feet bgs or refusal (Figure 6-1).
- Collect one confirmation soil sample along each sidewall and collect one confirmation soil sample from the excavation floor. The sidewall soil samples will represent soil from ground surface to a depth of 2 feet bgs (Table 6-1).
- Analyze the soil samples to confirm that DRO, Aroclor 1262, and benzo(a)pyrene and dibenzo(a,h)anthracene are no longer present at concentrations greater than the associated cleanup goals (Table 2-1).
- Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.

7. Copco No. 2 Burn Pit

This section summarizes the background and site-specific removal activities for the Copco No. 2 Burn Pit. Detailed descriptions of the site background and of the risk assessment results determined after evaluation of the analytical results from the site assessment are respectively provided in the California SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this California RAP by reference.

7.1 Background

The *Draft Phase I Environmental Site Assessment of the Parcel B Lands* (AECOM 2020a) identified an approximate 10- by 10-foot burn pit south of the Copco No. 2 Powerhouse and up the hill from Copco 2 Village. Wood pallets, tree branches and limbs, and other debris were observed to be piled on the burn pit. A pile of soil was located on the northwest edge of the burn pit. Additional site features included a backhoe and an area of concrete rubble.

Per the California SI Report, concentrations of DRO in surface soil, where a backhoe had been parked, exceeded acceptable human health risk levels. Concentrations of some PAHs in surface soil within the concrete rubble area also exceeded acceptable human health risk levels. The lateral extent of PAHs also was not delineated within the concrete rubble area. At the burn pit, concentrations of a dioxin (i.e., 2,3,7,8-Tetrachlorodibenzo-P-dioxin [2,3,7,8-TCDD]) toxic equivalent (TEQ) exceeded risk-based criteria for human health and ecological receptors, and the vertical extent of 2,3,7,8-TCDD TEQ was not delineated. Concentrations of naphthalene at the burn pit exceeded acceptable soil leaching criteria, and the vertical extent of naphthalene was not delineated. Consequently, soil removal with offsite disposal was recommended for these areas.

7.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at the Copco No. 2 burn pit:

- At the backhoe parking location, excavate an approximate 20- by 32-foot area to a depth of 1 foot bgs or refusal (Figure 7-1). Collect one confirmation soil sample along each sidewall and collect one confirmation soil sample from the excavation floor (Table 7-1). The sidewall soil samples will represent soil from ground surface to a depth of 1 foot bgs. Analyze the soil samples to confirm that DRO concentrations are less than the cleanup goal of 960 milligrams per kilogram (mg/kg).
- At the concrete rubble area, excavate an approximate 12- by 13-foot area to a depth of 1 foot bgs or refusal (Figure 7-1). Collect one confirmation soil sample along each sidewall and collect one confirmation soil sample from the excavation floor (Table 7-1). The sidewall soil samples will represent soil from ground surface to a depth of 1 foot bgs. Analyze the soil samples for PAHs to confirm that benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene concentrations are less than the associated cleanup goals (Table 2-1).
- At the burn pit, excavate an approximate 38- by 40-foot area to a depth of 4 feet bgs or refusal (Figure 7-1). Collect confirmation soil samples from one location along the northwestern and southeastern sidewalls, from two locations along the northeastern and southwestern sidewalls, and from two locations on the excavation floor (Table 7-1). The sidewall soil samples will represent soil from ground surface to a depth of 2 feet bgs and from a depth of 2 to 4 feet bgs. Analyze the soil samples for dioxins and PAHs to confirm that 2,3,7,8-TCDD TEQ and naphthalene concentrations are less than the associated cleanup goals (Table 2-1).
- Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.

8. Iron Gate Shooting Range

This section summarizes the background and site-specific removal activities for the Iron Gate Shooting Range. Detailed descriptions of the site background and of the risk assessment results determined upon evaluation of the analytical results from the site assessment are respectively provided in the California SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this California RAP by reference.

8.1 Background

An informal shooting range is located approximately 2,000 feet east of the Iron Gate Dam. Lead concentrations in soil were found to exceed human health criteria at soil borings IGSR-03, IGSR-19, and IGSR-21 and were also found to exceed ecological risk criteria at these borings and at boring IGSR-02. This shooting range is used occasionally by the general public and is not subject to daily use by multiple shooters. The shooting range will be closed when the Iron Gate Dam is demolished. The results and conclusions of this sampling event are likely indicative of site conditions after the shooting range is closed.

8.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at the Iron Gate Shooting Range:

- Excavate to a depth of 2 feet bgs or refusal in a 75- by 110-foot area at the long-range target and 6 vertical feet up the hillside behind the target (Figure 8-1).
- Excavate the northeast one-third of the berm at the short-range target to match the surrounding ground surface (Figure 8-1).
- Excavate to a depth of 1 foot bgs or refusal in a 50- by 50-foot area in front of the short-range target berm (Figure 8-1).
- Stockpile the excavated soil and sample it for lead to confirm that lead concentrations are nonhazardous. Once the analysis is complete, dispose of the soil at the appropriate disposal facility.
- Collect 24 confirmation samples along excavation sidewalls and 22 confirmation samples from the excavation floor to verify lead concentrations in remaining soil are less than 34 mg/kg (Table 8-1).
- Upon confirmation that impacted soil has been removed, grade out and seed the remaining berm and adjacent areas to stabilize the areas in anticipation of KRRC's placement of the Iron Gate Dam spoils in this area.

9. Iron Gate Hatchery Burn Pit

This section summarizes the background and site-specific removal activities for the Iron Gate Hatchery Burn Pit. Detailed descriptions of the site background and of the risk assessment results determined upon evaluation of the analytical results from the site assessment are respectively provided in the California SIWP and SI Report (Jacobs 2021a; Jacobs 2023b). Such information is incorporated into this California RAP by reference.

9.1 Background

An approximate 20- by 20-feet burn pit is located approximately 100 feet south of Bogus Creek and approximately 400 feet east of the Iron Gate Hatchery settling ponds. In February 2018, a soil investigation was conducted to assess the presence of potential contaminants that may have been introduced from the burning of wood pallets and other wastes at the site (AECOM 2019). Three soil borings were advanced to a depth of 1.5 feet bgs within the burn pit., and two soil samples were collected from each boring. The soil samples were analyzed for CAM 17 metals, mercury, total petroleum hydrocarbons, diesel-range organics (TPH-d), total petroleum hydrocarbons, gasoline-range organics (TPH-g), total petroleum hydrocarbons, motor oil (TPH-mo), VOCs, SVOCs, and PCBs. Concentrations of metals were determined to be less than background concentrations for the Cascade Range (ODEQ 2013); VOCs, SVOCs, and PCBs were not detected. TPH-d, TPH-g, and TPH-mo were detected at concentrations that were less than the San Francisco Regional Water Quality Control Board (2019) environmental screening levels. Because dioxins and furans were not analyzed under the Phase II performed by AECOM (2019) and because the burn pit may have been utilized after the Phase II was performed, additional sampling was recommended in the California SIWP.

Per the California SI Report, arsenic is present in site soil at concentrations that exceed acceptable human health risk levels from surface grade to a depth of 0.5 foot bgs in the burn pit and in the berm pushed up at the back of the burn pit. Consequently, soil removal with offsite disposal was recommended for the burn pit and surrounding berm.

9.2 Site-Specific Removal Actions

The following site-specific removal actions will be performed at the Iron Gate Hatchery Burn Pit:

- Excavate an approximate 33- by 35-foot area to a depth of 0.5 foot bgs or refusal (Figure 9-1).
- Collect confirmation soil samples from one location along each sidewall and collect one confirmation soil sample from the excavation floor (Table 9-1). The sidewall soil sample locations will represent soil from ground surface to a depth of 0.5 foot bgs.
- Analyze the soil samples for arsenic to verify that arsenic concentrations in remaining soil are less than 19 mg/kg (Table 2-1).
- Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.

Table 9-1. Confirmation Sample and Analysis Plan for Soil at Iron Gate Hatchery Burn Pit

COMMENT MATRIX for the Stakeholder Review Draft Dated June 2023
Lower Klamath Hydroelectric Project Soil Removal Action Plans for California and Oregon
FERC No. P-14803
September 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
California Department of Fish and Wildlife - Office of Spill Prevention and Response/California Department of Water Resources (Comments on the Soil Removal Action Plan for California)					
CA-1	KT	General Comment		The California RAP states that soil cleanup goals are risk-based concentrations that are protective of human health and leaching to groundwater. It is unknown if dilution factors for transport between groundwater and surface water were considered in the risk analysis. CDFW-OSPR reiterates that if sufficient validation is not available for a specific dilution factor, please make the conservative assumption that there is no dilution of contaminants between ground and surface waters. If groundwater at Copco No. 2 Wood-Stave Penstock and Wood Pile (Parcel B REC 7) is hydraulically connected to the water of Klamath River, PacifiCorp/Jacobs must ensure contaminants do not enter State waters at levels deleterious to fish, mammals, plant life or bird life (Fish and Game Code section 5650).	PacifiCorp did not apply a groundwater dilution factor to surface water. The San Francisco Regional Water Quality Control Board (SFRWQCB) environmental screening levels (ESLs) used in this investigation pertaining to soil leaching (SFRWQCB 2019) are protective of freshwater habitat. As stated in Section 3.2 of the California Site Investigation Report: "Soil leaching values for protection of freshwater habitat were evaluated for COPCs at each site." The freshwater aquatic habitat screening levels and sources are listed in Table GW-2 of the 2019 ESL Workbook (SFRWQCB 2019). The most conservative freshwater habitat screening level for groundwater/surface water is used to determine the soil leaching values as presented in Table S-3 of the 2019 ESL Workbook (SFRWQCB 2019). Therefore, contaminants that enter State waters at concentrations less than the screening levels for soil leaching are protective of freshwater habitat, including fish, mammals, plant life, and bird life. Termination of water flow within the penstock has eliminated the water source and disconnected any hydraulic connection between the water accumulated water beneath the penstock and the Klamath River. PacifiCorp expects the soil removal action to demonstrate that: (1) soil beneath the penstock has dried out, thereby removing a hydraulic connection; and (2) site-specific constituents of concern (COCs) with concentrations greater than acceptable soil leaching screening levels have been removed (to be demonstrated based on the analytical results of excavation floor and sidewall confirmation samples). Groundwater was not encountered during sampling and the depth to groundwater is not known at the Wood Pile (Parcel B REC 7). The soil removal action is expected to demonstrate that site-specific COCs with concentrations greater than acceptable soil leaching screening levels have been removed (to be demonstrated based on the analytical results of excavation floor and sidewall confirmation samples). No changes necessary.
CA-2	KT	Soil Removal Action Plan for California	Page 3-1, Section 3, Implementation Plan	The California RAP should include the following plans: - Contingency Plan - Site Coordination Plan Please add the above plans into the California RAP and change "Spill Response Plan" to "Spill Prevention and Response Plan."	Section 3.1.18, Contingency Planning has been added. Section 3.1.19, Site Coordination Plan has been added. Section 3.1.12, Spill Response Plan has been changed to "Spill Prevention and Response Plan." The same edits have been made to the Oregon Soil Removal Action Plan.
CA-3	KT	Soil Removal Action Plan for California	Page 3-1, Section 3.1.4, Mobilization and Site Preparation	CDFW requests that a biological monitor be on site during mobilization and throughout all field activities to ensure that wildlife are not impacted by site activities, and that any impacts to special status species are minimized. Please also include the following biological avoidance, minimization, and mitigation measures to be implemented for the protection of special status species that may be present on or near the site during field activities. i. CDFW would typically require pre-construction biological surveys by a qualified biologist approved by CDFW, however CDFW assumes that much of KRRC's pre-construction clearance work would overlap with the clean-	PacifiCorp has added Section 3.1.4, Biological Resources, which reads as follows: "The following biological avoidance, minimization, and mitigation measures will be implemented for the protection of special-status species that may be present on or near the site during field activities: ▪ A preconstruction biological assessment will be completed by a qualified biologist to review potential effects on biological resources before removing debris and implementing the soil removal actions at each site. This will include all removal areas, staging and laydown areas, and undeveloped access routes.

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
				up activities. To confirm CDFW's assumption, please identify where all project activities will occur (e.g., access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas). If project activity will occur in an area outside of KRRC's pre-construction clearance work then a survey should be performed. ii. A qualified biologist shall conduct a Biological Resource Education Program briefing to all contractor and subcontractor personnel prior to any site entry. To be considered as qualified, the biologist will be experienced with and knowledgeable about the special status species and habitats present or potentially present on or adjacent to the site. The qualified biologist shall train all personnel on the location of sensitive habitat, identification of all special status species, instructions of procedure when encountering one, and general environmental laws. New employees will attend a briefing by the qualified biologist prior to participating in work activities. iii. If remedial activities occur during the nesting season (February 1 - September 15), a focused survey for nesting birds shall be conducted by a qualified biologist for all access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas 1 to 2 weeks prior to commencement of any project activities or a return to work activities. The qualified biologist must survey the work area and all natural habitats occurring within 500 feet of the work area, to identify active nests. The qualified biologist shall look for new nests at least twice per week during remedial activities that occur during nesting season. iv. If nesting birds are found during surveys, CDFW shall be notified, the locations shall be identified on a map, and no project activity shall occur within 250 feet for raptors and 100 feet for other non-listed birds of an identified active nest until the young have fledged (as determined by a qualified biologist) or until the project proponent receives authorization from CDFW to proceed. If a qualified biologist and CDFW determine the project activity would not be likely to adversely affect the nest, CDFW may authorize the project proponent to proceed. The qualified biologist shall remain on site to monitor the activity of the nesting birds during work activities. If the birds behave normally, the qualified biologist shall monitor them twice per week to ensure the status has not changed. If the birds change their behavior as a result of work activities, the qualified biologist shall continue to monitor the birds as work is modified until the birds act normally. The qualified biologist shall then monitor the birds twice per week to ensure the status has not changed. Through consultation with CDFW, measures will be developed to minimize impacts to nesting birds. Vegetation containing nests that must be removed as a result of project implementation shall be removed during the non-nesting season (September 16 – January 31).	▪ All field team members, including the removal contractor and lower-tier subcontractors, will complete the online KRRC Biological Resource Training program as part of premobilization activities. ▪ A preconstruction nesting survey will be completed by a qualified biologist for sites with remedial activities planned to occur during the nesting season (February 1 – August 31). If nesting birds are found during surveys, the California Department of Fish and Wildlife (CDFW) will be notified, and no Project activity will occur within 250 feet for raptors and 100 feet for other nonlisted birds until a site-specific mitigation and monitoring plan has been developed (including reporting requirements) and agreed upon with CDFW." Note that PacifiCorp adjusted the end date from September 15 as suggested in the comment to August 31 so that the ending of the nesting bird period is consistent between the OR and CA RAPs and the dates in the RAPs are now consistent with the KRRC's approvals and permits. The following bullet was added to Section 3.1.14, Decontamination Procedures: ▪ The equipment decontamination area will be located in the designated upland staging area away from drainages. Section 3.1.2, Traffic Control, now reads as follows: "As necessary, traffic management will be implemented to manage the safe entry and exit of vehicles from the site. Equipment and personnel will be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas. Upland routes covered with pavement, bare ground, or non-native vegetation will be utilized as access routes to and from the excavation sites to the maximum extent practicable." Similar edits have been made to the Oregon Soil Removal Action Plan.

COMMENT MATRIX for the Stakeholder Review Draft Dated June 2023
Lower Klamath Hydroelectric Project Soil Removal Action Plans for California and Oregon
FERC No. P-14803
September 2023

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
				v. Equipment and personnel shall be confined to the designated access routes, staging and storage areas, stockpile areas, decontamination areas, and work areas. vi. The equipment decontamination area shall be located in the designated upland staging area away from drainages. vii. Upland routes covered with pavement, bare ground, or non-native vegetation shall be utilized as access routes to and from the excavation sites, to the maximum extent practicable. The qualified biologist shall complete a monitoring report for each day of monitoring, to include at a minimum: the date, location, weather, biologist's name, remedial activities occurring, special status species observed, species behavior in relation to remedial activities, and any corrective measures taken to protect the species. The biological monitoring reports should be submitted to CDFW for the duration of the remedial activities.	
CA-4	KT	Soil Removal Action Plan for California	Page 3-5, Section 3.1.16, Confirmation Soil Sampling	Please add statements or paragraphs in the section as follows: i. If the data fall outside the limit of specified accuracy, precision, and recovery, or have problems that affect comparability, the laboratory leader must contact the Quality Assurance Officer (QAO) and discuss available options to correct or rectify the situation. The QAO will have final authority on decisions made for correcting or rectifying problems. ii. Quality assurance reports will be prepared annually by the QAO and will include a detailed report of data precision, accuracy, and completeness for each type of analysis. Included in the final laboratory report will be a summary of the practices used to assess data precision, accuracy, and completeness. The QAO will review and approve these reports and include results of performance and system audits, and corrective actions that have occurred. iii. All significant quality assurance problems will be reported to the QAO as soon as possible along with recommendations for corrective action. iv. Any changes in quality assurance procedures, analytical procedures, sampling locations and frequencies, etc., will be submitted in writing to the QAO for approval prior to implementation of the changes.	The following language has been added to Section 3.1.20 consistent with the California Site Investigation Work Plan: "The analytical data provided by the analytical laboratory (accredited under the California Environmental Laboratory Accreditation Program) will undergo quality control checks for useability, then uploaded to a database for use in the analysis and reporting process." Additionally, Jacobs' internal, project-specific Quality Assurance Project Plan will be followed. All analytical data from the laboratory will be validated and evaluated by a qualified project chemist for quality assurance/quality control purposes. The results of the data validation and evaluation will be summarized in a Data Validation Report(s) that will be included in the California and Oregon Soil Removal Action Plans. This is the same process as was done for the California and Oregon Site Investigation Reports. The same language has been added to the Oregon Soil Removal Action Plan.
CA-5	KT	Soil Removal Action Plan for California	Page 3-7, Section 3.1.17, Backfilling and Site Restoration	It is unclear how habitat restoration will be conducted following excavation. The work site should be revegetated with native plants to restore the habitat and to prevent erosion of bare soils/backfill. Please include a description of the habitat restoration methods to be implemented, including seed mix and success criteria, to be used following habitat disturbance associated with the remediation. The habitat restoration plan should be submitted to the regulatory agencies for review and approval prior to implementation. We agree that the Iron Gate Shooting Range need only be stabilized to prevent erosion and dust in the most cost effective manner until KRRC places spoils on the site.	The work sites will be restored and stabilized in accordance with the requirements of the Stormwater Pollution Prevention Plan. This will include backfill and seeding with a native seed mix. The last bullet in Section 3.1.21, Backfilling and Site Restoration, has been modified to read as follows: ▪ If required, topsoil will be placed over backfilled areas and prepared for seeding. A commercially available native seed mix will be used for site restoration.

* KT = Kevin Takei/California Department of Fish and Wildlife

Klamath River Renewal Corporation (Comments on the Soil Removal Action Plans for California and Oregon)					
KRRC-General-1	LL	General Comment		All hazardous wastes are to be reported under PacifiCorp's EPA ID number	Acknowledged. In part, Section 3.1.11, Transportation Plan, now reads as follows: "Hazardous impacted soil identified for offsite disposal will be transported under a hazardous waste manifest with a PacifiCorp EPA Identification Number to an appropriate disposal facility." The same edit has been made to the Oregon Soil Removal Action Plan.
KRRC-General-2	LL	General Comment		Summaries of previously reviewed documents or materials are subject to such documents or materials in their entirety	Acknowledged. No changes necessary.
KRRC-General 3	LL	General Comment		Statements of future actions (e.g., closure determinations) remain subject to such facts and circumstances as may be known at the time in question	Acknowledged. No changes necessary.
KRRC-General 4	LL	General Comment		Removal activities are subject to coordination with KRRC	Acknowledged. PacifiCorp, Jacobs, and the KRRC's demolition contractors met on June 26 and July 12, 2023, to discuss project specifics. Additional meetings will be held per the Site Coordination Plan (see Comment CA-2 and Section 3.1.19).
KRRC-General 5	LL	General Comment		Removal Action Completion Reports (Section 3.2 in each plan): ▪ Should also include a narrative description of the work performed at each site, including a description and explanation of any unexpected findings and any deviations from the original plan. ▪ Any official correspondence, governmental sign-offs, closure letters received from federal/state/local agencies or similar communications should be included as an appendix to the Report.	The first bullet of Section 3.2, Removal Action Completion Report, now reads as follows: ▪ A narrative describing the work performed at each site, including an explanation of unexpected findings and required deviations from the original plan. The last bullet of Section 3.2 now reads as follows: ▪ Official correspondence, governmental sign-offs, closure letters received from federal, state, and local agencies, or similar communications to be included as an appendix to the report. The same edits have been made to the Oregon Soil Removal Action Plan.
KRRC-General 6	LL	General Comment		KRRC adopts such additional comments as either of the States may have.	Acknowledged. No changes necessary.
KRRC-1	LL	Soil Removal Action Plan for Oregon		No substantive comments. (A couple of typos that I'll send you separately.) [See below.] ▪ Section 3.1.3 - 1st bullet: "will approval" should probably be "will approve" ▪ Section 3.2 – 1st sentence: "… prepared to document that the soil removal activities that were performed …" Delete the highlighted "that"?	Acknowledged and received. Typos corrected.
KRRC-2	LL	Soil Removal Action Plan for California		No substantive comments on sites other than the wood-stave penstock.	Acknowledged. No changes necessary.
KRRC-3	LL	Soil Removal Action Plan for California	Wood-Stave Penstock	Regarding the wood-stave penstock: What is the reasoning behind only excavating the wood-stave penstock site to a depth of 1 [foot] bgs?	Per the California SI Report, pentachlorophenol and various polynuclear aromatic hydrocarbon (PAHs) [i.e., benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene] were identified in concentrations greater than acceptable

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
				▪ Is this due to suspected proximity to bedrock or for a different reason? ▪ What level of confidence do we have that 1 [foot] bgs is sufficient to remove all soil contaminated with PCP from the penstock site? This site is above standards for groundwater leaching to nondrinking water for pentachlorophenol (PCP) and is in close proximity to the river.	human health risk levels at soil borings C2WS-02, C2WS-04, C2WS-05, C2WS-06, C2WS-07, C2WS-08, C2WS-13, C2WS-14, C2WS-15, and C2WS-16 (Table D-2 of the CA SI Report). At soil borings C2WS-02, C2WS-04, C2WS-07, C2WS-08, and C2WS-14, unacceptable human health risk levels were identified in soil samples collected from surface grade to a depth of 0.5 foot bgs. Consequently, soil in the vicinity of these borings will be excavated to a depth of 1 foot bgs, and then confirmation soil samples will be collected to confirm that COCs are no longer present at concentrations greater than acceptable human health risk levels. If COCs are detected at concentrations greater than acceptable human health risk levels, over-excavation will be performed, where required and where possible (i.e., when not obstructed due to the presence of bedrock or boulders). At soil borings C2WS-05, C2WS-06, C2WS-13, C2WS-15, and C2WS-16, unacceptable human health risk levels were identified in soil samples collected at depths ranging from 0.5 foot to 1.5 feet bgs (borings C2WS-05, C2WS-06, and C2WS-16), 1.5 to 2.5 feet bgs (boring C2WS-15), and 2.0 to 3.0 feet bgs (boring C2WS-13). It is assumed that rocks and boulders will prevent significant over-excavation in the immediate vicinity of these borings. It is also assumed that the analytical results from confirmation sampling will demonstrate that COCs are no longer present at concentrations above acceptable human health risk levels. If COCs are detected at concentrations greater than acceptable human health risk levels, over-excavation will be performed, where required and where possible (i.e., unobstructed by bedrock or boulders). Figure 4-1 has been revised and Section 4.2 has been reworded as follows: "The following site-specific removal actions will be performed at the penstock with the understanding that boulders, bedrock, or both, may limit the vertical and lateral extents of the excavation: ▪ Excavate an approximate 50,000-square-foot area to a minimum depth of 1 foot bgs, or refusal (Figure 4-1). ▪ Based on an evaluation of analytical and risk assessment data from former soil borings C2WS-05, C2WS-06, and C2WS-16 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Locations 2, 3, and 5 to a depth of 3 feet bgs or refusal (Figure 4-1). ▪ Based on an evaluation of analytical and risk assessment data from former soil boring C2WS-15 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Location 4 to a depth of 4 feet bgs or refusal (Figure 4-1). ▪ Based on an evaluation of analytical and risk assessment data from former soil boring C2WS-13 (Jacobs 2023b), excavate an approximate 50- by 50-foot area at Location 1 to a depth of 4.5 feet bgs or refusal (Figure 4-1). ▪ Where the initial excavation depth is 1 foot bgs, collect confirmation soil samples along the northern and southern sidewalls. The sidewall samples will be spaced approximately 50 feet apart and will represent soil from ground surface to the bottom of the excavation. Also collect confirmation soil samples from the excavation floor. The floor samples will be spaced approximately 50 feet apart (Figure 4-1; Table 4-1).

No.	Reviewer Initials*	Item Under Review	Section and Page No. / DWG No.	Comment	Response to Comment
					▪ Where the initial excavation depths are 3, 4, or 4.5 feet bgs, collect one confirmation soil sample from the excavation floor. ▪ Where the initial excavation depths are 3, 4, or 4.5 feet bgs, collect confirmation soil samples from each excavation sidewall. Collect two soil samples from the respective northern and southern sidewalls of these deeper excavation areas. One sidewall sample will represent soil from ground surface to the midpoint of the excavation, and one sidewall sample will represent soil from the midpoint to the bottom of the excavation. Soil samples from the eastern and western sidewalls will represent soil from 1 foot bgs to the bottom of the excavation. ▪ Analyze the soil samples for pentachlorophenol and the following PAHs: benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene (Table 4-1). ▪ Upon confirmation that impacted soil has been removed, backfill and restore the site per Section 3.1.21.
KRRC-4	LL	Soil Removal Action Plan for California	Section 4.0	[Section] 6.7 of CA SIR states: "Additional investigation at this site following removal of the penstock may be warranted to refine the preliminary excavation area (Figure 6-2)." ▪ This appears to have been omitted from Section 4 of the California Soil Removal Action Plan. ▪ Will additional investigations at this site be performed prior to the start of excavation to determine the extent of PCP contamination and refine the preliminary excavation area? ▪ The SIR noted issues with investigative shovel probes at the penstock due to the presence of groundwater in the soil (suspected to be the result of the leaking penstock).	Additional investigation following removal of the penstock is no longer considered warranted given the overall dam removal and cleanup schedules. PacifiCorp has opted to excavate the area indicated (see Figure 4-1) and properly dispose of the soil offsite rather than iteratively perform additional site investigations with risk assessments and report review cycles. Consequently, the soil removal action will be performed as described in Section 4 of the California Soil Removal Action Plan. Over-excavation and confirmation sampling will also be performed, where required (see Comment KRRC-3 and Section 4.2). No additional changes are necessary.

KRRC-5	LL	Soil Removal Action Plans for California and Oregon	As indicated in bulleted comment	We'd like some clarification that PacifiCorp, Jacobs and their contractors will act in a manner that is consistent with KRRC's management plans (e.g., transportation, historic properties, etc.). For example: • Section 3.1.2 of the SRAP for each State refers to designated routes, staging and storage areas but does indicate that these will be as provided for in KRRC's transportation plan • Section 3.1.3 of the SRAP for each State refers to archeological monitoring but does not make clear that any such monitoring must be coordinated with KRRC's cultural resources team • Section 3.1.17 of the SRAP for each State refers to a Health and Safety Plan but does not make clear whether this will be KRRC's plan or one developed by Jacobs? If the latter then it must be consistent with KRRC's (See also the "Injuries or Accidents" Section of Table 3-1) • The last box in Table 3-1 of the SRAP for each State refers to the unexpected discovery of cultural resources. Again we'd like clarity as noted regarding Section 3.1.3 above. In addition, there's reference to an Inadvertent Discovery Plan that will apply if cultural resources are unexpectedly encountered – again, we'd like better clarity on whether this be KRRC's plan or one developed by Jacobs? If the latter then it must be consistent with KRRC's	PacifiCorp has been in close coordination with the onsite KRRC team as this removal plan has been developed and will continue to work with the KRRC's team as it is implemented; however, PacifiCorp is relying on the KRRC's team, through these comment periods, to identify areas of substantive conflict between the removal plans and the dam removal management plans. To date, no areas of conflict have been identified by the KRRC. Should an issue or conflict develop during implementation, PacifiCorp will work through that issue with the KRRC team. Responses for each bullet are provided as follows: • Staging and storage areas are specific to the removal action work and removal contractor needs. These areas have been identified in coordination with the KRRC team onsite (McMillen and Kiewit) and will continue to be coordinated through the execution of the work as indicated in Section 3.1.19, Site Coordination Plan. No additional changes are necessary. • The following text has been added to Section 3.1.3: *"Should cultural monitoring result in the inadvertent discovery of culturally sensitive resources, the Jacobs team will notify the KRRC's cultural resources team."* • The text in Section 3.1.17 and Table 3-1, Injuries and Accidents row (Table 3-2 in the California RAP) has been modified to clarify that Jacobs prepared the subject Health and Safety Plans. • Table 3-1 (Table 3-2 in the California RAP), Discovery of Cultural Resources or Human Remains, has been updated to indicate that cultural monitoring will be performed by Jacobs. This section already refers to the PacifiCorp's Inadvertent Discovery Plan and coordination with the KRRC's cultural resource team.
KRRC-6	LL	Soil Removal Action Plans for California and Oregon	Section 2, Risk Assessment Summary and Cleanup Goal	We'd like some clarification on risk management and contingency planning as follows: • Any incident that could lead to a claim affecting KRRC should be promptly reported to KRRC with appropriate reports to follow	This text has been added to Table 3-1 (Table 3-2 in the California RAP), Contingency Planning for Work Associated with Cleanup of Project Sites.
KRRC-General 7	LL	General		We incorporate any further comments either of the States may have.	Acknowledged. PacifiCorp recognizes that this line duplicates KRRC-General 6. The same comment was received twice and is included here for completeness. No changes necessary.

Oregon Department of Justice (Comments on the Soil Removal Action Plan for Oregon)					
OR-1	CM	General Comment		As you know, any such comments are not to be construed in any way as an Oregon approval regarding remediation process – all such work must be completed by PacifiCorp as per the relevant property transfer agreements and related agreements notwithstanding any communications as to the process. With that said, we continue to note that your plan makes no mention of any cultural resource monitoring and inadvertent discovery plan. By separate email you have indicated that such plans will be in place. Please confirm. Also, the plan for water for dust abatement will likely require hauling from offsite and/or an OWRD permit for any local pumping.	The cleanup locations have all been reviewed in relation to the potential for cultural resources to be present. Some sites have been precleared and will require no cultural resources monitoring. Others are in proximity to known cultural sites and will require monitoring during cleanup. Regardless of the presence of monitors, PacifiCorp's inadvertent discovery plan will remain in place for all work. Section 3.1.3, Cultural Resources has been added to the Oregon Soil Removal Action Plan. Given the limited amount of work and relatively small work areas in Oregon, water for dust control is not expected to be necessary. If it is necessary, water will either be obtained via permit from the Oregon Water Resources Department or from PacifiCorp's J.C. Boyle Development per an existing water right.
