RELIABILITY

Introduction and Reliability Discussion

This year's reliability report includes a brief overview of Pacific Power's programs and initiatives to evaluate and enhance reliability. This report is consistent with Oregon Administration Rules (OARs) 860-023, 024 and 028.

Monitoring, Recording, and Reporting Reliability

How Pacific Power Monitors Reliability

Outage Management and Reporting Systems:

Pacific Power operates automated outage management and reporting systems. Customer trouble calls and SCADA events are interfaced with the Company's real-time network connectivity model, its CADOPS system (Computer Aided Distribution Operations System). By overlaying these events onto the network model, the program infers outages at the appropriate devices (such as a transformer, fuse, or other interrupting device) for all customers down line of the interrupting device. The outage is then routed to appropriate field operations staff for restoration and the outage event is recorded in the Company's Prosper/US outage repository.

SCADA System and Momentary Interruption Indices:

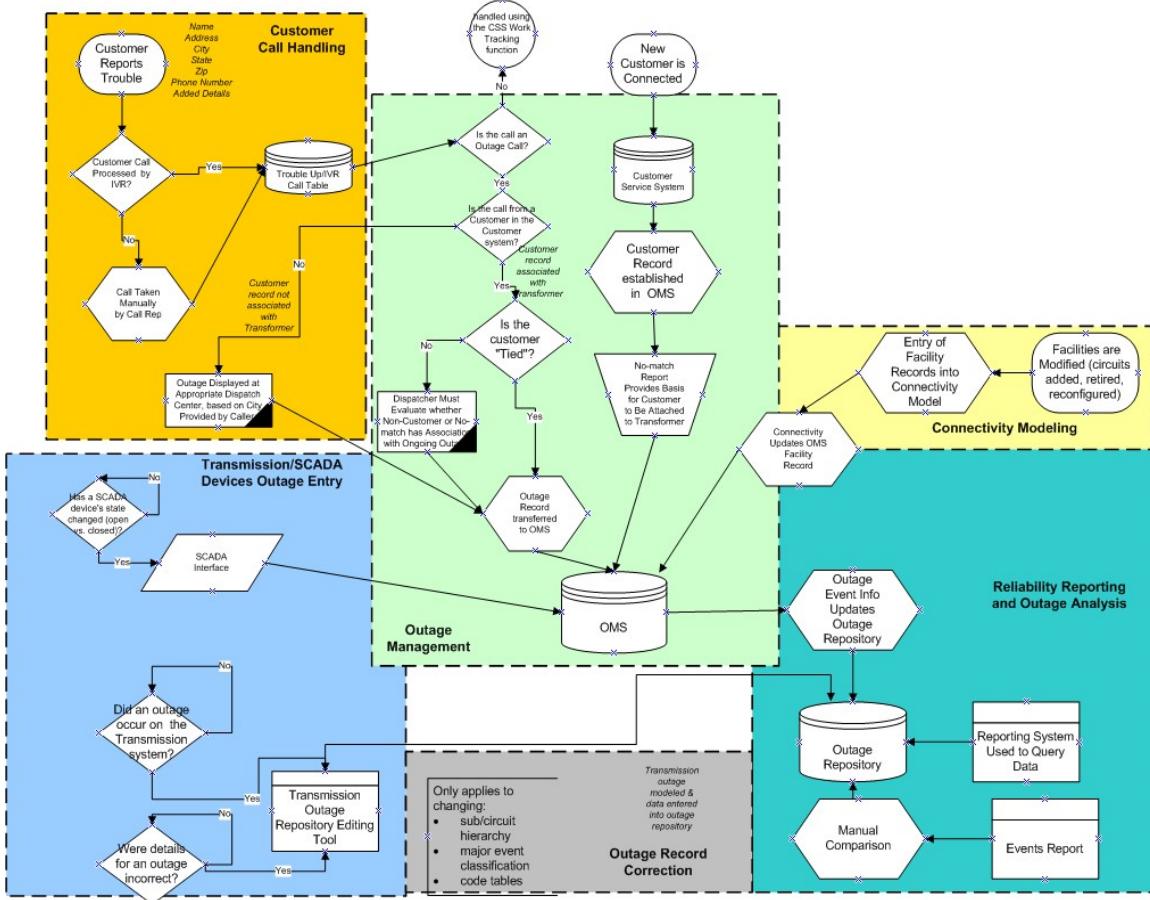

In addition to this real-time model of the system's electrical flow, the Company relies heavily upon the SCADA system it has in place. This includes the Dispatch Log System (an SQL database application), which serves to collect all events on SCADA-operable circuits. That data is then analyzed for momentary interruptions to establish state-level and circuit-level momentary interruption indices, per agreement with the Public Utility Commission of Oregon (OPUC) Staff.

Advanced Metering Infrastructure (AMI) System:

The Company has successfully implemented an Advanced Metering Infrastructure (AMI) system, enhancing its outage detection capabilities. This has led to the development of evolving strategies to eliminate false positives. While the Company has not yet observed significant effects on "metric uplift" that could hinder comparisons between past and future performance levels, it acknowledges the potential for such impacts in the future. The Company is also reviewing whether AMI data can replace momentary interruption reporting data; however, its development of these analytics is still underway.

New Developments:

As reported previously, the Company has implemented a new transmission outage reporting system, enhanced its automated processing of SCADA-based information, and is building new functionality in interfacing this information into its outage reporting system. This represents the ongoing efforts of the Company to improve its outage management and reporting capabilities.

Reliability Reporting: Interpreting Indices and Metrics

Reliability data, such as outage times, customer interruptions, and cause codes, is used to derive indices like System Average Interruption Duration Index (SAIDI), System Average Interruption Frequency Index (SAIFI), Customer Average Interruption Duration Index (CAIDI), and Momentary Average Interruption Frequency Index (MAIFI). These indices, standardized by the IEEE, are used by utilities to simplify complex data for reliability measurement and reporting.

For performance reporting as contained within this document¹, Pacific Power applies these indices at both the state and regional levels. These indices were first documented in IEEE Standard 1366-1998 and later updated in IEEE 1366-2003, 2012, and 2022. This standard was adopted in OAR 860-023 and all subsequent reports have complied with it.

Prior to 2012, major events excluded from performance were determined using the "10% of operating area customers" method, not the "2.5 beta" T_{Med} method of IEEE 1366. Therefore, year-on-year comparisons should be approached with caution.

Regional reporting areas were established using statistical tools to ensure performance met the assumptions of the major event thresholds in the standard. For the Customer Guarantee of the Performance Standards Program, exceptions may be determined based on state-level data.

¹ State administrative rules regarding service reliability were modified during 2011, which has resulted in significant modifications to this section of the report.

To devise circuit-level performance measures, Pacific Power conducted research to identify suitable metrics for ranking reliability investments to better serve customers. In 1999, Pacific Power implemented a balanced set of circuit performance indices (CPI⁹⁹) and methods that improve on those documented in IEEE 1366.

Circuit performance is reviewed annually against these metrics to select circuits for the Company's Worst Performing Feeders Program. Over time, as tools have evolved, the Company has focused its analysis at a sub-circuit level, optimizing cost against reliability metric improvements.

Reliability Tools: Improving Indices and Metrics

The Company uses reliability data to enhance service to its customers. Pacific Power has developed methods, as per the industry guide for electric reliability, IEEE 1782-2022², to analyze outage data in various formats like tables, graphs, and maps. This data helps develop projects that improve reliability.

These projects include the fuse coordination program (Fuse It or Lose It - FIOLI), the circuit hardening program (Saving SAIDI), and the capital construction program (Network Initiatives). Each project is evaluated for its potential to improve network reliability by reducing customer interruptions and is selected based on cost-effectiveness and alignment with budget and resource targets.

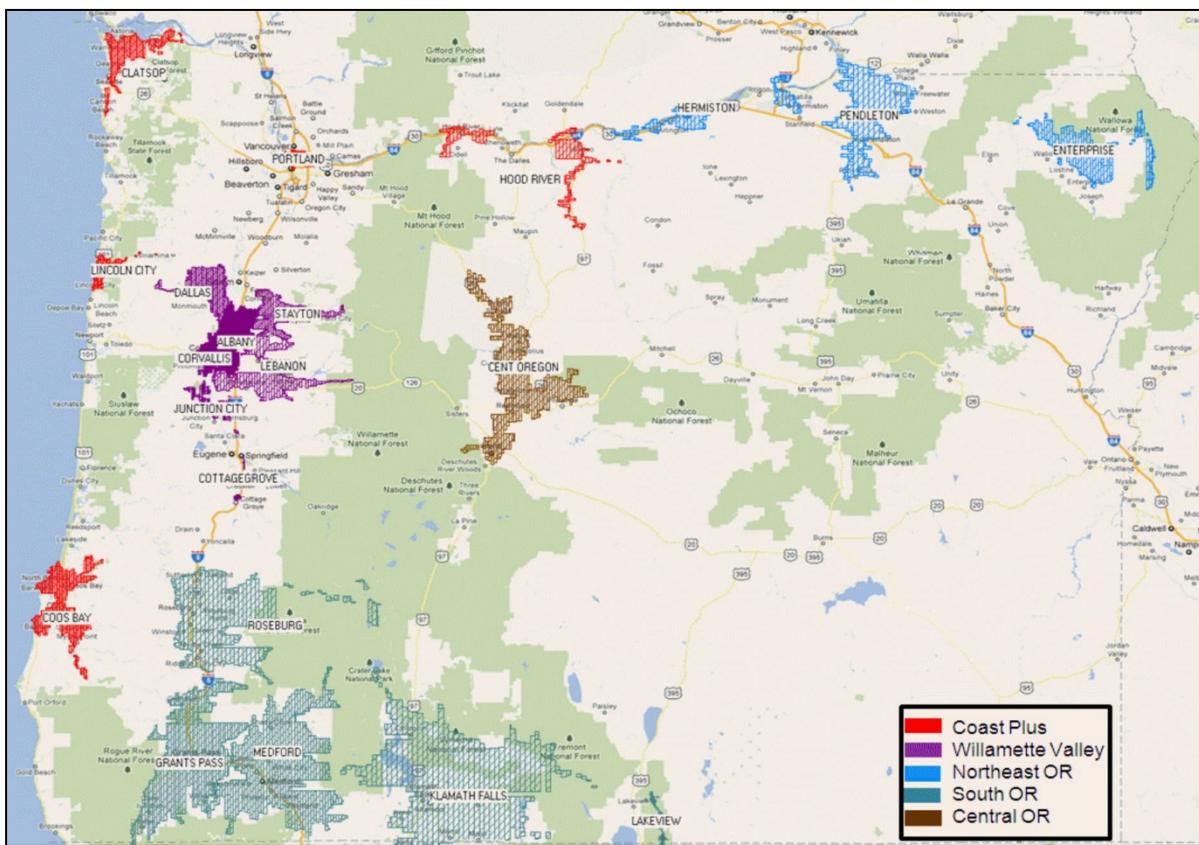

Pacific Power has also developed web-based notifications that alert when interrupting devices (like circuit breakers, reclosers, or fuses) operate more frequently than expected. This allows the engineering and operations teams to quickly assess and improve performance in that area of the system.

The Company conducts an annual reliability planning process, supplemented by interim updates. They also identify five "underperforming circuits" each year and report on their performance using blended reliability metrics (SAIDI, SAIFI, MAIFI, and breaker lockouts) to track changes over a five-year period. This process has proven effective based on a review of historical reliability performance. These circuits are discussed later in the document.

² IEEE-1782 (PE/T&D) Guide for Collecting, Categorizing and Utilization of Information Related to Electric Power Distribution Interruption Events was approved on May 13, 2022, and contains many of the approaches used by Pacific Power to evaluate system reliability and determine areas where improvements should be deployed.

Reliability Reporting Regions Map

The graphic below shows the grouping of operating areas into five reliability reporting regions.

Elevated Fire Risk Settings (EFR)³

As part of the Company's wildfire mitigation programs, the Company may use protection coordination settings, referred to as "Elevated Fire Risk" (EFR) settings, that more substantially affected distribution system performance than standard settings. In 2021, the Company developed a method to estimate the reliability impacts of the device setting changes. EFR settings are applied when fire weather conditions, such as high winds, low fuel moisture, elevated temperature, low relative humidity, and volatile fuels, are greatest. When EFR settings are used, certain operational responses may also differ, which may result in more sustained outage events and longer outage duration. The underlying metrics reported are reduced by the quantities shown below.

2023		Elevated Fire Risk Non-Major Event				Elevated Fire Risk During a Major Event			
Region		CML	CI	State SAIDI	State SAIFI	CML	CI	State SAIDI	State SAIFI

³ The Company uses the terminology of 'Elevated Fire Risk' (EFR) to denote instances when our circuits are operating under heightened sensitivity due to environmental conditions that could potentially increase the likelihood of a wildfire ignition.

Major Event Thresholds

Effective CY2012, the administrative rules were modified to replace the 10% of operating area customers methodology with IEEE 1366-2022 “2.5 beta” or T_{Med} methodology for determining major events. For Pacific Power’s service territory in Oregon, all operating areas were grouped into five reliability reporting regions and each reliability region’s threshold determined according to IEEE 1366-2022. The tables below depict the composition of each region and its threshold as used during 2023 and for application during 2024. Since certain major events may be filed as a statewide event, the state threshold and history are also supplied.

Targeted Reliability

The Company annually establishes a list of targeted reliability projects for which it calculates cost per forecast reliability improvements, expressed as mitigation costs factored by avoided customer minutes interrupted or \$/cmi. These projects often involve fuse coordination, circuit hardening (including animal, vehicle, and vegetation management efforts) and reconductoring. The current roster of projects intended to be constructed during 2024 are shown below.

Under-Performing Circuits

After the completion of the development of reliability improvement plans (as discussed above), the Company evaluates those circuits whose blended reliability scores rank low, using its Circuit Performance Indicator (CPI). This is the primary basis for the next year's Worst Performing Feeders element of its Targeted Reliability Program. CPI is an acronym for Circuit Performance Indicator, which uses 3-year weighted reliability metrics of the circuit to identify underperformance. The Company targets a 20% average improvement in this metric to validate its effectiveness. The application of CPI⁹⁹ proved to demonstrate more consistently how performance comparisons could be made. The variables and equation for calculating CPI are:

$$\text{CPI} = \text{Index} * ((\text{SAIDI} * \text{WF} * \text{NF}) + (\text{SAIFI} * \text{WF} * \text{NF}) + (\text{MAIFI} * \text{WF} * \text{NF}) + (\text{Lockouts} * \text{WF} * \text{NF}))$$

Index: 10.645

SAIDI: Weighting Factor 0.30, Normalizing Factor 0.029

SAIFI: Weighting Factor 0.30, Normalizing Factor 2.439

MAIFI: Weighting Factor 0.20, Normalizing Factor 0.70

Lockouts: Weighting Factor 0.20, Normalizing Factor 2.00

Therefore, $10.645 * ((3\text{-year SAIDI} * 0.30 * 0.029) + (3\text{-year SAIFI} * 0.30 * 2.439) + (3\text{-year MAIFI} * 0.20 * 0.70) + (3\text{-year breaker lockouts} * 0.20 * 2.00)) = \text{CPI Score}$

The following distribution feeders were selected as under-performing based on CPI scores ending December 31, 2023, and identified as Program Year 2024 circuits in the Network Initiatives program:

INSPECTION AND MAINTENANCE PROGRAMS

Inspection and Repairs

In Calendar Year 2023 (January 01 through December 31, 2023), among distribution and transmission facilities (both overhead and underground), 3,036 'A' Priority conditions were recorded and 2,657 were corrected.

For 'B' priority conditions, 21,151 were identified and 16,337 were corrected in CY2023.

Reporting of 'C' priority conditions was terminated early 2014, however some are still occasionally entered into the inspection system inadvertently. 279 were identified in 2023 and these will be reviewed and reprioritized as required. 17 of 'C' priority conditions were corrected.

Pole and Overhead Facilities

- PacifiCorp is currently on a 10-year cycle for the Detail inspection and treatment of overhead Distribution and Transmission facilities. In CY2023, 56,973 Distribution, 4,942 Local Transmission and 6,277 Main Grid Transmission Detailed inspections were performed. Detailed inspections were performed on 15.24% of the total 447,326 overhead facilities.
- 37,865 Distribution poles, 3,821 Local Transmission poles and 256 Main Grid Transmission poles were Tested and Treated. Test and Treatment were performed on 9.38% of the total 447,326 overhead facilities.
- PacifiCorp replaced or reinforced 1,387 poles that were rejected through the Test and Treat inspection program. The CY2023 rejection rate was 2.51%.
- The visual inspection of the Distribution and Transmission system is on a 2-year cycle. In CY2023, 208,306 Distribution, 26,207 Local Transmission and 11,639 Main Grid inspections were performed for a total of 246,152 inspections which equates to 55.03% of the total overhead facilities. Random re-inspections were performed by operations managers to ensure uniform results and adherence.

B. Marina Inspection Program

The inspection of marinas is annual. In CY2023, 100% of marinas were inspected.

C. Line Equipment Maintenance

Line Equipment – Overhead Reclosers, Sectionalizers, Regulators, Switches

Line equipment is inspected during the 2-year cycle Visual Survey; therefore, inspection requirements have been met for Reclosers, Sectionalizers, Regulators and Switches.

INSPECTION AND MAINTENANCE PROGRAMS

SUBSTATION MAINTENANCE PROGRAMS

A. Performance Measure X3 Substation Maintenance Programs

1. Description - Substations are critical utility network facilities requiring more frequent inspections and testing of all its equipment. The Company will provide, at the annual meetings, information of its Substation maintenance programs.
2. Program Interval - The program interval will be dictated by the substation equipment operational requirements.
3. Program Expenditures - PacifiCorp is to submit an annual actual versus budgeted expenditures for all substations equipment maintenance programs.

B. Substation Security Inspections

Substation security inspections are performed on cycles based on policy. This includes a detailed inspection of the fence, gates, warning signs, grounding systems, etc. The inspector is trained to look for security violations and public hazards. Copies of the inspection results are filed at the substation and field office. Field personnel are instructed to immediately correct all perimeter security violations.

Reference PacifiCorp Maintenance Policy 034 - Substation Inspection Policy and form 3274F-Substation Inspection.

PacifiCorp operates 282 substation and communication facilities in Oregon. PacifiCorp performed 96.68% of the planned substation security inspections in CY2023.

C. Substation Equipment Inspections

Batteries, Capacitor Banks, Circuit Breakers, Switches, LTC's, Regulators, Transformers, and protective relays are inspected on cycles based on policy. Inspections check pressure, temperature, voltage, LTC and regulator operation, cooling equipment, insulators, relay targets, etc.
