VIA ELECTRONIC FILING

Public Utility Commission of Oregon 201 High Street SE, Suite 100 Salem, OR 97301-3398

Attn: Filing Center

RE: UM 1729 – Standard Avoided Cost Purchases from Eligible Qualifying Facilities – Compliance Filing

In compliance with OAR 860-029-0040(4)(a) and OAR 860-001-0420 and Order No. 18-096 in this docket and Order Nos. 14-058 and 16-174 in docket UM 1610, PacifiCorp d/b/a Pacific Power submits the enclosed update to its standard avoided cost information (formerly known as Schedule 37) to the Public Utility Commission of Oregon (Commission).

PacifiCorp is concurrently filing a Motion for Emergency Interim Relief in this docket.

This filing satisfies PacifiCorp's obligation under OAR 860-029-0040(4)(a) to provide updated avoided cost information within 30 days of Commission acknowledgement of the company's 2017 Integrated Resource Plan, as clarified by the Commission's decision in Order No. 18-096. Consistent with OAR 860-029-0040(4)(a), the enclosed proposed standard avoided cost schedules include an effective date of May 26, 2018.

PacifiCorp's current standard avoided cost prices were approved in Order No. 17-197 and became effective on June 1, 2017.

In support of this filing, PacifiCorp submits Appendix 1 – Avoided Cost Study and Appendix 2 – Method Write-up and Minimum Filing Requirements. Also provided are the supporting documentation in both "pdf" and original formats.

PacifiCorp respectfully requests that all communications related to this filing be addressed to:

Monthly Payments

A Qualifying Facility shall select the option of payment at the time of signing the contract under one of the Pricing Options specified above. Once an option is selected the option will remain in effect for the duration of the Facility's contract.

Renewable or Standard Fixed Avoided Cost Prices

In accordance with the terms of a contract with a Qualifying Facility, the Company shall pay for all separately metered kilowatt-hours of On-Peak and Off-Peak generation at the renewable or standard fixed prices as provided in this schedule. On-Peak and Off-Peak are defined in the definitions section of this schedule.

Firm Market Indexed and Non-Firm Market Index Avoided Cost Prices

In accordance with the terms of a contract with a Qualifying Facility, the Company shall pay for all separately metered kilowatt-hours of On-Peak and Off-Peak generation at the market prices calculated at the time of delivery. On-Peak and Off-Peak are defined in the definitions section of this schedule.

2036	9.64	4.89	9.87	4.89

- (1) Capacity Contribution to Peak for Avoided Proxy Resource and Base Load QF resource are assumed 100%.
- (2) The standard avoided cost price for wind and solar QFs located in PacifiCorp's balancing authority area (BAA) are reduced by an integration charge of \$0.57/MWh (\$2016) and solar integration charge of \$0.60/MWh (\$2016), respectively. For Solar and Wind QFs not located in PacifiCorp's BAA, the renewable avoided cost price will be increased by wind integration charge of \$0.57/MWh (\$2016) and solar integration charge of \$0.60/MWh (\$2016), respectively.
- (3) Standard Resource Sufficiency Period ends December 31, 2029 and Standard Resource Deficiency Period begins January 1, 2030.

2035	7.37	3.58	7.77 3.58
2036	7.51	3.65	7.92 3.65

- (1) For the purpose of determining: (i) when the Renewable Qualifying Facility is entitled to renewable avoided cost prices; and (ii) the ownership of environmental attributes and the transfer of Green Tags to PacifiCorp, Renewable Sufficiency Period ends December 31, 2020, and Renewable Deficiency Period begins January 1, 2021.
- (2) During the Renewable Resource Sufficiency Period, the renewable avoided cost price for a wind and solar Qualifying Facility located in PacifiCorp's BAA is reduced by wind integration charge of \$0.57/MWh (\$2016) and solar integration charge of \$0.60/MWh (\$2016), respectively. For Solar and Wind QFs not located in PacifiCorp's BAA, the renewable avoided cost price will be increased by the avoided wind integration charge of \$0.57/MWh (\$2016) and solar integration charge of \$0.60/MWh (\$2016), respectively.
- (3) During the Renewable Resource Deficiency Period, the renewable avoided cost price for a solar Qualifying Facility located in PacifiCorp's BAA (in-system) is reduced by the difference between the solar integration charge of \$0.60/MWh (\$2016) and wind integration charge of \$0.57/MWh (\$2016). For a wind Qualifying Facility located in PacifiCorp's (BAA), the adjustment is zero. For a solar Qualifying Facility not located in PacifiCorp's BAA, the renewable avoided cost price for solar QF will be increased by the difference between the solar integration and wind integration charges.
- (4) During the Renewable Resource Deficiency Period, the renewable avoided cost price for Base Load is increased by the avoided wind integration charge of \$0.57/MWh (\$2016).

- The avoided cost price is reduced by a solar integration charge of \$0.60/MWh (\$2016) for solar QF resources located in PacifiCorp's Balancing Area Authority (BAA) (in-system).
 If QF solar resource is not in PacifiCorp's BAA, prices will be increased by the \$0.60/MWh (\$2016) integration charges.

PACIFIC POWER AVOIDED COST CALCULATION

STANDARD RATES FOR AVOIDED COST PURCHASES FROM ELIGIBLE QUALIFYING FACILITIES

OREGON – APRIL 2018

PACIFIC POWER AVOIDED COST CALCULATION

STANDARD RATES FOR AVOIDED COST PURCHASES FROM ELIGIBLE QUALIFYING FACILITIES

OREGON – APRIL 2018

Standard avoided cost rates are paid to eligible small qualifying facilities (QFs). Oregon avoided cost filing requirements as listed in OAR 860-029-0040 and 860-029-0080 require the Company to file updated avoided costs at least every two years. The Commission Order No. 14-058, requires the Oregon investor owned utilities to update avoided cost prices annually on May 1 of each year and within 30-days of Integrated Resource Plan (IRP) acknowledgment. Annual updates, filed on May 1 of each year, are required to update the following data inputs: (1) natural gas prices; (2) on-peak and offpeak forward looking electricity market prices; (3) production tax credit status; and (4) any other action or change in an acknowledged IRP relevant to the calculation of avoided costs.

The last Oregon avoided costs were approved on June 01, 2017.

Sufficiency and Deficiency Periods

In Docket UM-1396 Order 10-488, the Commission directed that the start date of the first "major resource acquisition" in the action plan of the IRP determines the resource "sufficiency" and "deficiency" periods to be used in calculations of standard avoided cost prices. The sufficiency and deficiency periods used in this filing are based on the 2017 IRP which was acknowledged by the Commission on March 27, 2018.

Table 1 presents 2017 IRP Preferred Portfolio and shows that the earliest acquisition of a Combine Cycle Combustion Turbine (CCCT) is planned to be in 2030. Therefore, the resource sufficiency period for the standard avoided cost rates is from 2018-2029 and the non-renewable resource deficiency period starts in 2030. Table 1 also shows that earliest acquisition of the utility scale renewable resource is in 2021, and therefore the start of the renewable resource deficiency period is 2021.

Avoided Cost Calculation

Based on the 2017 IRP preferred portfolio shown in **Table 1**, the standard avoided cost calculation is separated into two distinct periods: (1) Standard non-renewable resource sufficiency (2018 through 2029) period; and (2) Standard non-renewable resource deficiency (2030 and beyond) period. During the non-renewable resource sufficiency period (2018 through 2029), standard avoided energy costs are based on blended market prices. Market prices from the Company's Official Forward Price Curve are weighted by market transactions required to support the addition of an assumed 50 MW Oregon

Qualified Facility. To calculate the weighting, two production cost studies are prepared. The only difference between the two studies is an assumed 50 aMW, zero running cost resource. System balancing sales and purchase volumes are extracted from both studies and the change between the two studies is calculated for each market hub. This volume impact is used to weight the Company's Official Market Price Forecast on-peak and offpeak market prices for COB, Mid-Columbia, and Palo Verde for each month. **Table 2** shows the result of this calculation.

The sufficiency period for standard renewable rates is 2018 through 2020 and the standard renewable resource deficiency period starts in 2021. During the renewable resource sufficiency period (2018 through 2020), the renewable avoided energy costs are based on blended market prices.

During the non-renewable resource deficiency period, the avoided costs are based on the fixed and variable costs of a CCCT proxy resource that could be avoided or deferred. The current CCCT proxy resource used to set standard avoided cost rates beginning in 2030 is a west side CCCT from the 2017 IRP.¹

Since CCCTs are built as base load units that provide both capacity and energy, it is appropriate to split the fixed costs of this unit into capacity and energy components. The fixed cost of a simple cycle combustion turbine (SCCT), which is usually acquired as a capacity resource, defines the portion of the fixed cost of the CCCT that is assigned to capacity. Fixed costs associated with the construction of a CCCT which are in excess of SCCT costs are assigned to energy and are added to the variable production (fuel) cost of the CCCT to determine the total avoided energy costs. **Table 3** shows the capitalized energy costs, which are calculated based on the difference between fixed costs of CCCT and SCCT. The fuel cost of the CCCT defines the avoided variable energy costs. The gas price forecast used as the basis for the CCCT fuel cost is discussed later in this document.

During standard renewable resource deficiency period, the standard renewable avoided cost prices are based on on-peak and off-peak prices of a renewable proxy resource from the 2017 IRP. The standard renewable on-peak price also includes a capacity adder calculated based on the fixed costs of a thermal proxy CCCT adjusted by the incremental capacity contribution of the QF resource relative to the avoided renewable proxy resource. The capacity adder is allocated to on peak hours by using the on peak capacity factor of the QF resource.

Table 4 shows the CCCT fuel cost, the addition of capitalized energy costs at an assumed 72.1% capacity factor, and the total avoided energy costs.

¹ 436 MW CCCT (Dry "G/H" 1x1) - West Side Resource (1500') –available in 2030 as listed in Tables 6.1 and 6.2 of the 2017 IRP. Fuel costs are from the Company's March 2018 Official Forward Price Curve (1803 OFPC).

² SCCT Frame ("F"x1) – East Side Resource (5,050'), as listed in Tables 6.1 and 6.2 of the 2017 IRP.

Because energy generated by a QF may vary, total standard avoided costs are calculated at 75%, 85% and 90% capacity factor to illustrate the impact of differing generation levels. This calculation is shown in **Table 5**.

Standard avoided costs are differentiated between on-peak and off-peak periods, with capacity costs allocated to on-peak periods. On an annual basis, approximately 56% of all hours are on-peak and 44% are off-peak. **Table 6** shows the calculation of on-peak and off-peak avoided energy prices.

For informational purposes, **Tables 7 and 8** show a comparison between current avoided costs currently in effect in Oregon and the proposed avoided costs in this filing.

Table 9 shows the calculation of the total fixed costs and fuel costs of the CCCT and SCCT that are used in **Table 3** and **Table 4**. In this filing, the Company's thermal proxy resource is a CCCT located on the west side of the Company's system. Current Commission approved standard non-renewable avoided costs are also based upon a CCCT located on the west side of the Company's system.

Gas Price Forecast

Gas prices used in this filing utilize the Company's March 2018 Official Forward Price Curve (1803 OFPC). **Table 10** shows the natural gas price used in this avoided cost calculation.

Table 11 shows wind and solar integration costs used in 2017 IRP.

Table 12 shows the calculation of total resource cost of the renewable proxy plant from 2017 IRP. The total cost of the proxy wind resource is used in the calculation of standard renewable avoided cost rates as shown in "**Exhibits 5 through 8**".

Table 13 shows the calculation of on-peak and off-peak standard renewable avoided cost prices by applying on-peak and off-peak factors. On-peak and off-peak factors are calculated as a ratio of the average annual on-peak Mid-C market price to the flat Mid-C market price.

Exhibit 1 – Std Base Load QF tab shows the calculation of proposed standard avoided cost rates for a base load QF. On and off-peak avoided cost rates are based on blended market rates for 2018-2029. For 2030 and beyond, the off-peak price is based on the fuel and capitalized energy cost of the CCCT proxy. The on-peak price also includes a capacity adder based on the fixed costs of the CCCT proxy (in \$/kW-yr). The adjusted capacity adder in \$/kW-yr is allocated to on peak hours by using the on peak capacity factor of the base load QF resource, which is assumed to be equal to on peak capacity factor of CCCT proxy resource.

Exhibit 2 – Std Wind QF tab shows the calculation of proposed standard avoided cost rates for a wind QF. On and off-peak avoided cost rates are based on blended market rates for 2017-2029. For 2030 and beyond, the off-peak price is based on the fuel and capitalized energy cost of the CCCT proxy. The on-peak price also includes a capacity adder calculated based on fixed costs of the CCCT proxy (in \$/kW-yr) adjusted by the expected capacity contribution of a wind QF as identified in the 2017 IRP (West side Wind: 11.8%). The adjusted capacity adder (in \$/kW-yr) is allocated to on peak hours by using the on peak capacity factor of a west side wind QF resource. Standard avoided cost rates for a wind QF are reduced by a wind integration charge of \$0.57/MWh (\$2016).

Exhibits 3 & 4 – Std Solar QF tab shows the calculation of proposed standard avoided cost rates for a solar QF. On and off-peak avoided cost rates are based on blended market rates for 2017-2029. For 2030 and beyond, the off-peak price is based on the fuel and capitalized energy cost of the CCCT proxy. The on-peak price also includes a capacity adder calculated based on the fixed costs a thermal proxy CCCT (in \$/kW-yr) adjusted by expected capacity contribution of a solar QF as identified in the 2017 IRP (West side fixed solar: 53.9%, tracking solar: 64.8%). The adjusted capacity adder (in \$/kW-yr) is allocated to on peak hours by using the on peak capacity factor of a solar QF resource. Standard avoided cost rates for a solar QF are reduced by a solar integration charge of \$0.60/MWh (\$2016).

Exhibit 5 – Renewable Base Load tab shows the calculation of proposed standard renewable avoided cost rates for renewable base load QF. For 2017-2020, on- and off-peak renewable avoided cost rates are based on blended market rates. For 2021 and beyond, on- and off-peak prices are based on on-peak and off-peak prices of the renewable wind proxy resource as calculated in Table 12 and Table 13. Starting in 2030, the standard renewable on-peak price also includes a capacity adder calculated based on the fixed costs of the CCCT proxy (in \$/kW-yr), adjusted by the incremental capacity contribution of a renewable Base Load QF relative to the avoided renewable east side wind proxy resource. The adjusted capacity adder in \$/kW-yr is allocated to on peak hours by using the on peak capacity factor of a base load QF resource, which is assumed to be equal to on peak capacity factor of CCCT proxy resource. During resource deficiency period rates are increased by avoided wind integration charge.

Exhibit 6 – Renewable Wind tab shows the calculation of proposed standard renewable avoided cost rates for a wind QF. On- and off-peak renewable avoided cost rates are based on blended market rates for 2017-2020. For 2021 and beyond, on- and off-peak prices are based on on-peak and off-peak prices of the renewable wind proxy resource as calculated in Table 12 and Table 13. Starting in 2030, the standard renewable on-peak price also includes a capacity adder calculated based on the fixed costs of the CCCT proxy CCCT (in \$/kW-yr), adjusted by the incremental capacity contribution of a renewable west side Wind QF relative to the capacity contribution of the avoided east side renewable proxy wind resource. The adjusted capacity adder in \$/kW-yr is allocated to on peak hours by using the on peak capacity factor of a west side wind QF resource.

During renewable resource sufficiency period of 2018-2020, the standard renewable avoided cost rates for a wind QF are reduced by wind integration charge.

Exhibits 7 & 8 – Renewable Solar tab shows the calculation of proposed standard renewable avoided cost rates for a Renewable Solar QF. On- and off-peak renewable avoided cost rates are based on blended market rates for 2017-2020. For 2021 and beyond, on- and off-peak prices are based on on-peak and off-peak prices of the renewable wind proxy resource as calculated in Table 12 and Table 13. Starting in 2030, the standard renewable on-peak price also includes a capacity adder calculated based on the fixed costs of a thermal proxy CCCT (in \$/kW-yr), adjusted by the incremental capacity contribution of a renewable Fixed and Tracking Solar QF relative to the avoided renewable east side wind proxy resource. The adjusted capacity adder in \$/kW-yr is allocated to on peak hours by using the on peak capacity factors of a solar QF resource. During renewable resource sufficiency period, the standard renewable avoided costs rates for fixed and tracking solar QF resources are reduced by solar integration charge. During renewable resource deficiency period, the rates are adjusted by the difference in avoided wind and solar integration charges.

Exhibit 9 – **Blending** tab shows the market blending used to weight the Company's Official Forward Price Curve on-peak and off-peak market prices at COB, Palo Verde and Mid-Columbia by month, which are used in the calculation of rates shown in **Table 2.**

${\bf I.\ Resource\ Sufficiency\ /\ Deficiency\ Demarcation}$

		Explanation	IRP Reference	
1.	Non-renewable: Identify the demarcation year for the end of sufficiency period / start of deficiency period.	Deficiency starting in 2030.	Table 8.17 – 2017 IRP Preferred Portfolio, page 244	
2.	Non-renewable: Identify the major resource to be acquired (>100 megawatts (MW) and longer than five years) at end of sufficiency period.	West Side Combined-Cycle Combustion Turbine (CCCT) (Dry "G/H" 1x1) with Duct Firing - West Side Resurce (1500').	Table 8.17 – 2017 IRP Preferred Portfolio, page 244.	
3.	Renewable: Identify the demarcation year for the end of sufficiency period / start of deficiency period.	Deficiency starting in 2021	Table 8.17 – 2017 IRP Preferred Portfolio, page 244	
4.	Renewable: Identify the major resource to be acquired (>100 MW and longer than five years) at end of sufficiency period.	Wyoming Wind Resource	Table 8.17 – 2017 IRP Preferred Portfolio, page 244 and Plant costs 2017 IRP Chapter 8, Page 220	

II. Gas Price Forecast

		Explanation	IRP Reference
1.	Identify the source of the gas price forecast.	Official forward price curve (OFPC) March 2018	-
2.	If the forecast source differs from that used in the most recent approved avoided cost filing / explain the reason(s) for the change.	The Company updates its OFPC every quarter. The March 2018 OFPC was the most recent curve available at the time of this filing. Currently effective rates were based on the March 2017 OFPC.	-
3.	Provide the yearly forecast price by year / and identify any rounding that has been applied.	Refer to the tabs entitled "Table 10" and "OFPC Source" of the Oregon Schedule 37 Avoided Cost Study work paper.	-
4.	Quantify and describe the extent to which the gas price forecast differs from the most recent approved avoided cost filing, include a description of carbon cost / tax assumption(s).	The Company updates its OFPC every quarter. The March 2018 OFPC was the most recent curve available that would have been used in the Company's April 2018 update. Currently approved rates were based on March 2017 OFPC. Refer to the spreadsheet entitled "OR Sch 37 - MFR - II.Gas Price Forecast _2017 04 25" for the comparison of the gas price forecast. Refer to the files entitled "201603 OFPC - Environmental" and "201703 OFPC - Environmental" for the March 2016 OFPC and March 2017 OFPC carbon tax assumptions.	-

III. Sufficiency Period Prices

		Explanation	IRP Reference
1.	List the market hub(s) used for market price projections, the source for the forward price curves, and any adjustments or blending used in deriving the sufficiency period prices.	Market prices for California-Oregon Border (COB), Mid-Columbia (Mid-C) and Palo Verde (PV) from the March 2016 OFPC are blended based on change in system balancing purchases and sales using two the Generation and Regulation Initiative Decision Tool (GRID) runs - with and without a 50 MW qualifying facility (QF) resource.	-
2.	Provide the transmission costs assumed used in sufficiency period prices.	No transmission costs are incorporated in standard sufficiency period avoided cost pricing.	-
3.	Provide all other component(s) used to calculate sufficiency period prices.	Prices for wind resources are adjusted to account for wind integration. For the complete calculation of sufficiency period prices, refer to Oregon Schedule 37 Avoided Cost Study work.	Wind integration: 2015 IRP Volume II-Appendix H, Table H.3

IV. Standard Rates Deficiency Period Resource

		Explanation	IRP Reference	
1.	Provide the resource type, geographic location, nameplate capacity, and annual capacity factor.	CCCT (Dry "J" Adv 1x1) with Duct Firing - West Side Options (1500'), Annual Energy weighted CF is 72.1 percent. Refer to Table 9 of Oregon Schedule 37 Avoided Cost Study work paper.	2015 IRP Table 6.1 and Table 6.2.	
2.	Provide the source of natural gas supply / and the costs assumed for interconnection / infrastructure upgrades, transmission, storage, and any other costs necessary to deliver gas.	Burner Tip West Side Gas, refer to Table 10 of Oregon Schedule 37 Avoided Cost Study work paper.	-	
3.	Provide the assumed heat rate. Include assumptions to account for elevation / temperature, and cooling method.	Refer to Table 9 of Oregon Schedule 37 Avoided Cost Study work paper.	2015 IRP Table 6.1 and Table 6.2.	
4.	List the costs assumed for interconnection facilities. 2015 IRP Table 6.1		2015 IRP Table 6.1 and Table 6.2.	
5.	List the components of transmission costs used and their respective values.	-	2015 IRP Table 6.1 and Table 6.2.	
6.	List the tax assumptions used.	-	2015 IRP Table 6.1 and Table 6.2.	

V. Renewable Rates Deficiency Period Resource

	_	Explanation	IRP Reference	
1.	Provide the resource type, geographic location / nameplate capacity, and annual capacity factor.	Renewable proxy plant costs and performance characteristics are from the 2015 IRP.	Table 6.2– 2015 IRP - Plant Costs (2014\$).	
2.	Provide assumptions used for mechanical availability, annual hours of curtailment / and annual megawatt-hours (MWh) of energy curtailed.	None.		
3.	List the costs assumed for interconnection facilities.	-	Table 6.2 – 2015 IRP - Plant Costs (2014\$).	
4.	List the components of transmission costs used and their respective values.	-	Table 6.2 – 2015 IRP - Plant Costs (2014\$).	
5.	List the tax assumptions used. This includes assumed taxes paid (federal, state / local), and assumed tax benefits (e.g. PTC / investment tax credits (ITC) / grants in lieu of credits).	No PTC.	Table 6.2 – 2015 IRP - Plant Costs (2014\$).	
6.	Provide the capacity contribution value, and the method used to derive the capacity contribution value / for solar and wind resource types.	Capacity Contribution values - Wind: 25.4 percent, Fixed Solar: 32.2 percent, and Tracking Solar: 36.7 percent.	2015 Capacity Contribution Study, 2015 IRP Volume II- Appendix N, Table N.1, page 405.	
7.	Provide the wind integration cost used / and the method used to derive the wind integration cost.	\$3.06 per megawatt-hour (\$/MWh) (2014\$).	2015 IRP Volume II-Appendix H, Table H.3.	

California CO₂: No Update

California cap-and-trade policy assumptions in Aurora

- Program start date was 2012 with 2013 being the first compliance year for power plants.
- In the absence of a Federal CO₂ tax, California CO₂ is assumed to continue post 2021 in accordance with current program guidelines.
- Assumed California cap-and-trade prices come from an third-party expert's forecast of California Carbon Allowance (CCA) prices.
- All fossil-fired generating units operating within California generate emissions consistent with the CO₂ content of the fuel and the unit's heat rate
- For instance, a combined cycle plant with a 7,500 Btu/kWh heat rate burning natural gas, with a CO₂ content of 118 lb/MMBtu, would produce 0.44 tons of CO₂ emissions for each MWh generated
- The assumed California CO₂ allowance price is modeled as a dispatch cost adder and applied to plant CO₂ emissions.

111(d) Policy: No Update

- On August 3, 2015, the Environmental Protection Agency (EPA) released its finalized Clean Power Plan (CPP) (aka 111(d)) setting state-specific interim and final goals for carbon dioxide emissions beginning 2022. By 2030, each state* is to be fully compliant with EPA's calculated goal and maintain it post 2030. The Rule's objective is a 32% reduction in 2005 power sector emissions by 2030. *Note: Vermont is exempt from 111(d).
- ▶ EPA used three building blocks to define the "best system of emission reduction" (BSER). The three building blocks include:
 - Coal plant efficiency improvements of 2.1% 4.3%.
 - Increased utilization of natural gas-fueled units to average 75% of net summer capacity.
 - Increased deployment of zero-emitting resources.
- Using these building blocks the EPA calculated state-specific goals via three different formats, allowing each state to choose its format:
 - A rate-based goal CO₂ pounds per MWh.
 - A mass-based goal short tons of CO₂.
 - A mass-based goal with a new source complement short tons of CO₂.
- States must develop plans (states can also enter into multi-state plans) to meet the established goal. State compliance mechanisms are flexible and do not need to be based on the three building blocks used to establish BSER. Plans are to be submitted to the EPA in the 2016-2018 timeframe. In developing the September 2016 OFPC, the 111(d) regulation was modeled with the following assumptions:
 - No coal unit efficiency improvements are implemented
 - Renewable generation is tracked by renewable energy credit (REC) ownership, not by state boundary
 - New natural gas combined cycle units (NGCC) are regulated under 111(d) in all states
 - Energy efficiency acquisition as assumed in EPA's calculation of emission rate goals is achievable
 - WECC-wide compliance targets are assumed (excluding California), using the sum
 of state allowance allocations with new source complement.

111(d) Policy (cont.): No Update

▶ On March 28, 2017, President Trump issued an Executive Order directing the EPA to review the Clean Power Plan and, if appropriate, suspend, revise or rescind the Clean Power Plan, as well as related rules and agency actions. We will continue to follow activities related to this Executive Order and update the Aurora model as appropriate.

Federal CO₂ Allowance Pricing: No Update

Federal CO₂ allowance pricing assumptions in Aurora

With the addition of modeled impacts of EPA's 111(d) Clean Power Act, there is no assumed Federal CO₂ allowance pricing.

State & Federal CO₂: No Update

California cap-and-trade policy assumptions in Aurora

- In the absence of a Federal CO₂ tax, California CO₂ is assumed to continue post 2030. July 25, 2017 Governor Jerry Brown signed into law the extension of California's existing cap-and-trade program to 2030, per Assembly Bill 398.
- Aurora's cap-and-trade prices come from an third-party expert's forecast of California Carbon Allowance (CCA) prices.
- All fossil-fired generating units operating within California generate emissions consistent with the CO₂ content of the fuel and the unit's heat rate
- For instance, a combined cycle plant with a 7,500 Btu/kWh heat rate burning natural gas, with a CO₂ content of 118 lb/MMBtu, would produce 0.44 tons of CO₂ emissions for each MWh generated
- The assumed California CO₂ allowance price is modeled as a dispatch cost adder and applied to plant CO₂ emissions.

October 10, 2017 EPA Chief Scott Pruitt signed a proposal for EPA to withdraw its Clean Power Plan, without an immediate replacement.

The CPP is no longer assumed and no Federal CO2 program is currently modeled in Aurora.

Gas Price Forecast Comparison

		- ···· I · · · · · · · · · · · · · · · · · · ·			
		OFPC March 2018	OFPC March 2017		
		West Side Gas	West Side Gas	Change	% Change
20	030	5.10	4.99	0.11	2%
20)31	5.09	5.22	(0.13)	-2%
20)32	5.48	5.50	(0.02)	0%
20)33	5.78	5.89	(0.11)	-2%
