Re: Docket No. UE 350 – In the Matter of Idaho Power Company's 2019 Annual Power Cost Update

Attention Filing Center:

Attached for filing in the above-captioned docket is Idaho Power Company's Supplemental 2019 March Forecast Testimony (Idaho Power/300-307).

Please contact this office with any questions.

Sincerely,

A handwritten signature in blue ink that reads "Alisha Till".

)
_____)

**IDAHO POWER COMPANY
SUPPLEMENTAL DIRECT TESTIMONY
OF**

MARK A. ANNIS

April 8, 2019

1 **Q. Please state your name, business address and present occupation.**

2 A. My name is Mark A. Annis. I am employed by Idaho Power Company ("Idaho Power"
3 or "Company") as a Senior Regulatory Analyst in the Regulatory Affairs department.
4 My business address is 1221 West Idaho Street, Boise, Idaho 83702.

5 **Q. Please describe your educational background.**

6 A. I earned a Bachelor of Arts degree in Business Administration (accounting emphasis)
7 from the University of South Dakota in May 1984. That year I also passed the Uniform
8 Certified Public Accounting ("CPA") exam and am currently a licensed CPA in the state
9 of Idaho. I have also attended electric utility ratemaking and financial courses,
10 including "Introduction to Rate Design and Cost of Service" presented by Electric
11 Utilities Consultants, Inc.

12 **Q. Please describe your business experience with Idaho Power.**

13 A. I began my employment with Idaho Power in 1997 in the Company's Finance
14 department as an Accountant II, where I performed a variety of general and corporate
15 accounting duties, with a focus on external reporting and accounting research. Over
16 the next 18 years I held several other positions within the Finance department,
17 including Business Analyst II, Technical Research Coordinator, External Reporting
18 Team Leader, and Financial Reporting and Accounting Research Manager. In these
19 positions I was responsible for a variety of tasks, including researching accounting
20 policy issues and implementing new accounting standards, including Federal Energy
21 Regulatory Commission ("FERC") accounting and reporting issues, completing the
22 Company's quarterly and annual reports filed with the Securities and Exchange
23 Commission, reviewing FERC Form 1, and analyzing financial statements.

24 In May 2016 I accepted a position as the Budget and Revenue Manager in the
25 Finance department. In this position I acted as a liaison between the Regulatory
26

1 Affairs and Finance departments, as well as overseeing aspects of the Company's
2 budgeting processes.

3 In March 2017, I went on a temporary duty assignment in the Regulatory Affairs
4 department, and in March 2018 I transitioned full-time to Regulatory Affairs as a Senior
5 Regulatory Analyst. As a Regulatory Analyst, I provide support for the Company's
6 various regulatory activities, including regulatory ratemaking and compliance filings.

7 **Q. What is the purpose of your testimony?**

8 A. The purpose of my testimony is to provide the Company's updated forecast of benefits
9 related to participation in the Western Energy Imbalance Market ("EIM"), replacing and
10 supplementing the benefits forecast included in the initial March 25, 2018, filing.¹ My
11 testimony will also detail the revised proposed rates resulting from the Company's
12 update to the EIM benefits forecast. It is important to note that no other changes have
13 been made to any other elements of net power supply expense ("NPSE") included in
14 the March forecast, and therefore, discussion of those other elements is not repeated
15 in this testimony.

16 **Q. What is the status of this proceeding?**

17 A. The Company filed the 2019 October Update on October 31, 2018, and the Public
18 Utility Commission of Oregon ("Commission") Staff ("Staff") and the Oregon Citizens'
19 Utility Board ("CUB") reviewed the filing. Three rounds of discovery requests have
20 been served on the Company since the initial filing. The parties held an initial
21 workshop on January 22, 2019, to discuss the 2019 October Update filing.

22 On February 4, 2019, Staff filed opening testimony and CUB indicated that it
23 would not be filing opening testimony. On March 4, 2019, the Company, Staff, and
24 CUB filed waivers of cross-answering and reply testimony.

25
26 ¹ *Re Idaho Power Company's Application for Authority to Implement a Power Cost Adjustment Mechanism*, Docket No. UE 195, Order No. 08-238 (Apr. 28, 2008).

1 On March 25, 2019, the Company filed the 2019 March Forecast containing a
2 preliminary forecast of EIM benefits for the upcoming April 2019 through March 2019
3 time period. At that time, the Company indicated that it was still finalizing its forecast
4 of benefits related to EIM participation, and that its final quantification would be
5 completed and filed as supplemental testimony within two weeks of March 25, 2018.

6 On April 4, 2019, the Company, Staff, and CUB participated in a Settlement
7 Conference. Following the Settlement Conference, Idaho Power conferred with CUB
8 and Staff with regard to modifying the procedural schedule of this case to allow more
9 time for Staff and CUB to review Idaho Power's supplemental testimony to be filed
10 April 8, 2019. After reaching agreement with Staff and CUB, Idaho Power filed a
11 "Motion to Modify Procedural Schedule" on April 5, 2019, which was approved on April
12 8, 2019. This motion extended the date for Staff and CUB's initial March Forecast
13 testimony from April 10, 2019, to April 24, 2019.

14 **Q. How is your testimony organized?**

15 A. My testimony presents the Company's updated EIM benefit forecast for the 2019
16 Annual Power Cost Update ("APCU"), detailing each of the forecast adjustments the
17 Company made to develop an accurate quantification of expected benefits over the
18 April 2019 through March 2020 time period. My testimony then provides an updated
19 quantification of the projected revenue requirement increase and the proposed rate
20 implementation to allocate the revenue increase to customers.

21 **Q. Are you updating any of the exhibits previously filed in this proceeding?**

22 A. Yes, I am providing the following exhibits, which update those included in the
23 Company's March 25, 2019, March Forecast filing:

24 1. Exhibit 301, determination of expected NPSE for the 2019 March
25 Forecast.

26

2. Exhibit 302, determination of normalized NPSE for the 2019 October Update.
3. Exhibit 303, year-over-year differences in modeled NPSE.
4. Exhibit 304, October Update and March Forecast combined rate calculation.
5. Exhibit 305, revenue spread.
6. Exhibit 306, calculation of revenue impact.

Q. Are you introducing any new exhibits?

A. Yes, I'm introducing Exhibit 307, which details the calculation of the Company's EIM benefits forecast.

I. EIM COSTS AND BENEFITS

Q. What revised level of EIM benefits is Idaho Power proposing to include in the 2019 APCU?

A. Idaho Power is proposing to include \$11.93 million in system EIM benefits as an offset to NPSE in the 2019 APCU. On an Oregon allocated basis, the EIM benefits to be included in the 2019 APCU total \$0.55 million.

Q. How did the Company determine the level of EIM benefits to be included in the 2019 APCU?

A. The level of EIM benefits to be included in the 2019 APCU is based initially on the California Independent System Operator ("CAISO") report of EIM benefits. As discussed in Idaho Power's initial March Forecast testimony, the Company identified several issues with the CAISO's method of calculating EIM benefits and has been actively working with Power Settlements and CAISO to shadow and validate CAISO's benefit calculation. Previous testimony describes the shadow calculations and corrections to the CAISO methodology resulting from this process. After review of the CAISO methodology, the Company determined that additional adjustments are

1 necessary to develop an appropriate adjustment to the Company's modeled NPSE
2 that reasonably reflects the ongoing cost savings benefits associated with Idaho
3 Power's participation in the EIM. These adjustments, which I will detail individually,
4 include an adjustment to the CAISO methodology as it pertains to the hydro pricing
5 cost structure, an adjustment to forecasted Greenhouse Gas ("GHG") payments,² and
6 an adjustment for third-party load included in the Company's balancing area. The
7 Direct Testimony of Nicole A. Blackwell previously filed in this matter on March 25,
8 2019, identified each of these issues as requiring further analysis.

9 **Q. Please summarize the issue identified with CAISO's counterfactual**
10 **methodology that has since been corrected for all participating entities.**

11 A. As discussed in the testimony of Ms. Blackwell filed on March 25, 2019, CAISO agreed
12 to correct its counterfactual ("CF") modeling assumption for all EIM entities on a going-
13 forward basis. This correction was based on an invalid assumption utilized by CAISO
14 associated with using the transfer price as a floor, as detailed on pages 18 through 20
15 of Ms. Blackwell's testimony.

16 **Q. What were the results of this correction to CAISO's methodology?**

17 CAISO agreed to re-run the fourth quarter benefits calculation for Idaho Power, which
18 resulted in a corrected benefit amount of \$5.8 million, a 44 percent decrease from the
19 initial estimate. Due to the administrative burden, CAISO chose not to re-run or re-
20 publish prior quarters' Western EIM Benefits Reports for Idaho Power, but did agree
21 to re-run one month from the second and third quarters of 2018 with the corrected

22 ² Idaho Power bids all of its participating resources (hydro, coal, and natural gas generation)
23 into the EIM. To the extent any of this generation is imported into California, Idaho Power receives
24 GHG payments from the EIM to reimburse the cost of Carbon Allowances required by California to
25 offset emissions from this generation. In the case of hydro resources where there are no carbon
26 emissions, these payments are revenue without associated Carbon Allowance obligations, and
therefore, all these payments are used to reduce net power supply costs.

1 modeling methodology. For the second quarter of 2018, CAISO re-ran its June
2 benefits calculation which resulted in a reduction from the initial benefits estimate of
3 \$2.64 million to \$1.90 million, a 28 percent reduction for the month of June. For the
4 third quarter of 2018, CAISO re-ran its August benefits calculation which resulted in a
5 reduction from the initial estimate of \$6.36 million to \$4.43 million, a 30 percent
6 reduction for the month of August. These revised CAISO EIM benefit amounts were
7 not published publicly but were provided to Idaho Power for informational purposes.

8 **Q. Did Idaho Power incorporate these revised calculations in its Company-**
9 **developed EIM benefits calculation?**

10 A. Yes. Using the CAISO reported EIM benefits as a starting point, Idaho Power's first
11 step in calculating its own EIM benefit estimate was to extrapolate the monthly
12 reductions in CAISO-stated EIM benefits for the months of June and August 2018 for
13 the entire second and third quarters of 2018. Specifically, Idaho Power applied the 28
14 percent reduction identified for the June 2018 benefits uniformly to each of the
15 remaining months in the second quarter, which resulted in a revised second quarter
16 EIM benefits amount of \$5.6 million compared to the \$7.8 million published by CAISO.
17 Idaho Power also uniformly applied the 30 percent reduction identified for the August
18 2018 benefits to the entire third quarter, which resulted in a revised third quarter EIM
19 benefits amount of \$9.3 million compared to the \$13.3 million published by CAISO.

20 At the time of this filing, the first quarter 2019 CAISO benefits report is not yet
21 available. However, the Company performed a shadow calculation and validated the
22 CAISO benefit results for January 2019, which included CAISO's corrected modeling
23 methodology related to CF bid costs and determined that CAISO's EIM benefit
24 calculation of \$1.6 million appropriately reflected the agreed-upon methodology
25 changes as included in the quarterly revisions by CAISO. Because CAISO has not
26 yet published the first quarter 2019 results, Idaho Power then applied the January

1 2019 CAISO EIM benefit estimate to the remaining months of the first quarter of 2019,
2 resulting in a total first quarter 2019 benefit estimate of \$4.9 million. Using these
3 results, Idaho Power estimated an annual EIM benefits amount of \$25.6 million using
4 the corrected CAISO methodology. The derivation of this amount is presented on
5 Exhibit 307, columns A-C. As previously stated, this amount requires three additional
6 adjustments to develop an accurate forecast of EIM benefits for Idaho Power in the
7 context of an adjustment to modeled NPSE. These adjustments are reflected in
8 columns D through H of Exhibit 307 and consist of a hydro pricing adjustment, a GHG
9 benefits adjustment, and a third-party load adjustment.

10 **Q. Please describe the adjustment related to the hydro pricing cost structure.**

11 A. CAISO's CF dispatch cost is based on bid prices submitted for each participating
12 resource, which CAISO assumes is equal to the true dispatch cost, or the economic
13 value, of the resources. For most resource types, this assumption may be reasonable;
14 however, this assumption is not accurate for hydro resources. Because hydro is a
15 zero-variable cost resource, Idaho Power bids hydro resources based on an
16 operational value rather than the actual dispatch cost. When Idaho Power operators
17 move water into the higher tiers, which have a higher bid price, it is a response to
18 operational needs and does not reflect market benefits. Without adjusting for these
19 operating scenarios, CAISO's CF dispatch results in a baseline that is inaccurate for
20 reflecting cost savings of participation in the market.

21 The Company has a system of hydro "tiers", both operational and pricing, for
22 EIM offers. Operational tiers are utilized by the Company's Load Serving Operations
23 group ("LSO"), while the pricing components associated with each tier are established
24 by the Company's Power Supply Merchant group ("PSM"). The LSO determines
25 available hydro energy for various operational conditions and reservoir management
26 requirements, which is used by operators to allocate energy among a set of tiers.

1 Based on this operational information, the PSM develops and submits bids to the EIM
2 market operator. In other words, the LSO communicates operational goals to the
3 PSM, and the PSM establishes pricing based on these operational goals.

4 The LSO determines how much water should go into each tier considering
5 multiple system condition factors, including but not limited to, how much the EIM has
6 already dispatched Company resources up or down in previous hours, whether Idaho
7 Power's system is surplus or deficit compared to what was planned on preschedule,
8 and how much flexibility the Company has to deviate from the daily targeted flows
9 through the Company's Hells Canyon Complex. Thus, the operational tiers reflect
10 operational goals and the amount of water that is available for each tier. Lower tiers
11 generally reflect a greater ability to move water and generate energy with less of an
12 impact on future planned operations.

13 The PSM establishes pricing tiers with the lowest tier having lower prices and
14 higher tiers having higher prices. Consistent with FERC's Standards of Conduct, the
15 operators have no visibility or influence on the establishment of price, and the PSM
16 has no visibility or influence on the amount of water placed into each tier. The PSM
17 establishes the prices using seasonal values that include expected future energy for
18 dispatch based on minimum flow requirements.

19 To manage the varying system conditions and ensure that Idaho Power
20 manages its water appropriately, the Company is often forced to allocate energy to
21 higher tiers to reduce volatility and maintain hydro flows within required ranges.³ As
22 an example, if the EIM has already increased generation significantly in previous
23 hours, the Company may have already increased its daily average flows by the amount
24 permitted, resulting in the need to allocate energy to higher tiers in future hours to
25

26 ³ Requirements may include flood control obligations, fish flow obligations, etc.

1 prevent flow of more water than allowed during a particular timeframe. There are also
2 timing restrictions that impact the allocation of hydro energy among operational tiers.
3 For example, the Company typically plans to operate its hydro generation resources
4 in a manner that reserves water for periods of the day when demand is at its highest.
5 If Idaho Power allocates too much energy to a lower operational tier and the EIM
6 dispatches this energy over several hours, then the Company may not have enough
7 water to increase generation during a higher load period and may have to purchase
8 energy rather than relying on its own resources to serve load.

9 For reasons such as these, Idaho Power operators must carefully select the
10 operational tiers into which water is placed. When Idaho Power operators move water
11 into the higher tiers, it is a response to operational needs, not economics. The CF
12 calculation incorrectly reflects the tier price as the avoided cost for hydro (as zero cost
13 resources) thereby overstating the resulting benefits.

14 **Q. How did Idaho Power adjust CAISO's EIM benefit calculation to reflect the**
15 **economic value of hydro rather than the bid price?**

16 A. Prior to joining the EIM, Idaho Power had three hydro tiers that identified the value of
17 water made available to PSM for market sales. The first tier was typically utilized
18 during spill conditions and was given the lowest price by the PSM. The second tier
19 included energy posted to the PSM that could be sold, required no immediate
20 replacement, and had minimal impacts on operations. The third tier reflected energy
21 that could be sold by the PSM but would likely require the purchase of replacement
22 energy in a future period and was given a higher price by the PSM. Prior to joining the
23 EIM, the second and third tiers were utilized most of the hours under normal operating
24 conditions.

25 When the Company joined the EIM, the three existing tiers were maintained
26 and designated as INC Tiers 1, 2, and 3, and three additional tiers were established,

1 INC Tiers 4, 5, and 6, to provide additional granularity for EIM dispatch decisions. INC
2 Tiers 4, 5, and 6 were created to allow the operators to reflect more extreme market
3 and system conditions where any EIM dispatches of the water in those tiers could
4 potentially have significant negative operational and reliability impacts. These tiers
5 are typically used by operators to meet target reservoir elevations needed to meet
6 future load serving requirements and to optimize the water for future generating hours.
7 Thus, the PSM's pricing for INC Tiers 4, 5, or 6 reflects the operational value – not the
8 dispatch cost – of the water to Idaho Power. As such, the Company determined that
9 for purposes of the EIM benefit calculation to serve as an adjustment to modeled
10 NPSE, all tiers should be replaced with a zero cost for hydro resources.

11 **Q. Did Idaho Power replace the higher tier prices reflected in CAISO's benefit**
12 **calculation for all months?**

13 A. No. In Idaho Power's shadow calculation, it replaced the tier prices reflected in
14 CAISO's benefit calculation for all months of the fourth quarter with a zero cost. By
15 doing so, the revised EIM benefits were \$2.5 million, which is a \$3.3 million or 56
16 percent reduction to CAISO's fourth quarter EIM benefit of \$5.8 million.

17 Because Idaho Power's trial period with Power Settlements began in mid-
18 September 2018, there is a lack of bid data available to shadow the CAISO benefit
19 calculation prior to October 2018. As a result, Idaho Power could not input revised
20 costs into the shadow calculation to determine a revised benefit for the third quarter.
21 However, because system conditions in the third quarter of 2018 were similar to
22 conditions in the fourth quarter, the Company applied the 56 percent reduction due to
23 replacing hydro bids in all tiers with zero prices identified for the fourth quarter to
24 CAISO's benefit calculation for the third quarter. This resulted in a revised third quarter
25 EIM benefit estimate of \$4.1 million, which is \$5.2 million less than the CAISO third
26 quarter EIM benefit of \$9.3 million.

1 Additionally, at the time of this filing, CAISO benefits data was not available for
2 most of the first quarter, and the Company was not participating in the EIM in the first
3 quarter of 2018. However, Idaho Power was able to make an adjustment to the hydro
4 pricing structure for January 2019 which resulted in a revised estimate of \$1.2 million,
5 which is a \$451 thousand or 27 percent reduction from the CAISO January benefit
6 result of \$1.6 million. Because Idaho Power did not have final numbers for February
7 or March 2019, the Company applied the 27 percent reduction to the remaining months
8 of the first quarter, resulting in a revised first quarter benefit estimate of \$3.6 million,
9 down 1.4 million from the estimated first quarter benefit of \$4.9 million.

10 Because system conditions were similar between the first and second quarters,
11 and due to a lack of bid data available for the second quarter as mentioned above, the
12 Company also applied the 27 percent reduction due to replacing hydro bids in all tiers
13 with zero prices identified for January 2019, to CAISO's benefit calculation for the
14 second quarter. This resulted in a revised second quarter EIM benefit estimate of \$4.1
15 million, which is \$1.5 million less than the CAISO second quarter EIM benefit of \$5.6
16 million.

17 **Q. What are the resulting benefits after correcting for the hydro pricing structure?**

18 A. After applying the more accurate hydro pricing structure to CAISO's benefit
19 calculations, Idaho Power's estimate of EIM benefits is \$14.3 million. The impact of
20 this change in methodology can be seen in columns D through E of Exhibit 307.

21 **Q. Please explain the change in the CAISO's procedures related to GHG payments.**

22 A. On November 1, 2018, CAISO implemented changes that were approved by FERC to
23 revise its EIM bid adder rules by adding language to its tariff that limits the hourly
24 dispatchable bid range between the resource's base schedule and its effective upper
25 economic bid for the relevant operating hour. CAISO stated this will more accurately
26 attribute energy produced by EIM participating resources, because it will limit the

1 amount of a resource's output that can be designated as supporting a transfer into
2 CAISO when the resource has already been scheduled to serve load outside of
3 CAISO. CAISO further stated that the proposal reflects that capacity associated with
4 base schedules in advance of the real-time market is effectively committed to serve
5 EIM load and to meet specific resource sufficiency tests, and that this commitment
6 creates a base from which the market can determine what incremental capacity a
7 resource has available to serve load in the CAISO or another EIM Entity balancing
8 authority areas located within California. Since the GHG bid quantity is now limited
9 and the EIM dispatch will identify other participating resources that have available
10 capacity above their base schedule to support EIM transfers into CAISO, Idaho Power
11 expects a reduced financial benefit from net GHG revenues related to selling electricity
12 to CAISO.

13 **Q. Please describe the adjustment to reduce the GHG benefits resulting from the**
14 **Company's participation in the EIM.**

15 A. The Company made a forecast adjustment to expected EIM benefits for the April 2019
16 through March 2020 forecast period related to GHG benefits. The Company reduced
17 the estimate of GHG revenues to include in the 2019 APCU forecast by \$1,530,114,
18 as shown in column F of Exhibit 307. Idaho Power's actual GHG benefits for the prior
19 year were approximately \$4.7 million, with the final forecast amount of GHG revenues
20 included in the 2019 APCU forecast of EIM benefits revised to \$3.2 million.⁴

21 In estimating GHG awards for the 2019 APCU test period, for the forecast
22 months of November 2019 through March 2020, the Company used prior year actual
23 results, as actuals in these months already reflected the change by CAISO to limit the
24

25 ⁴ Please note, on page 24 of Ms. Blackwell's testimony filed March 25, 2019, Idaho Power
26 discussed the inclusion of \$3.3 million in net GHG benefits in the 2019 APCU. Due to do the
availability of additional data since the time of that filing, this testimony includes an updated net GHG
benefits forecast of \$3.2 million.

1 GHG bid quantity. For the forecast months of April through June, the Company also
2 used prior year actual results as these are hydro-dominated months in which GHG
3 revenues are significantly lower due to low market GHG allowance prices. For the
4 forecast months of July through October, the Company reduced prior year actuals
5 based on observed differences in actual GHG benefits subsequent to the change in
6 CAISO's GHG payment procedure, as shown in column G of Exhibit 307.

7 **Q. Previous testimony indicated that Idaho Power has concerns that benefits**
8 **related to third-party loads in the Company's balancing area authority ("BAA")**
9 **are included in CAISO's benefit calculation. Please explain.**

10 A. As explained in the prior testimony, the benefits reported by CAISO reflect a value for
11 the entire BAA each month. However, the Company has third-party load in its BAA
12 whose benefits are being included in CAISO's reported benefits for Idaho Power. To
13 better determine the benefits attributable to Idaho Power, the Company developed a
14 method to reflect the monthly EIM BAA benefits based on a load ratio allocation
15 between Idaho Power load and third-party customer loads in the Idaho Power BAA.

16 **Q. Please describe the adjustment to allocate a portion of the EIM benefits to third-**
17 **party load.**

18 A. The Company applied the monthly percentage of transmission load ratio share
19 attributable to its third-party load customer for April 2018 through February 2019.
20 Since March 2019 was not available at the time of this filing, the Company used the
21 load ratio share for February and applied this to March. This calculation determined
22 that on average, approximately 7.25 percent of the BAA load relates to the third
23 parties. In order to only include EIM benefits related to the Company, the EIM benefit
24 was reduced by \$803,519, which reflects the 7.25 percent of the total BAA EIM
25 benefits.
26

1 **Q. Please summarize the final estimate of EIM benefits to be included in the 2019**
2 **APCU.**

3 A. The Company's EIM benefits forecast is based on the CAISO's revised EIM benefits
4 reports, with adjustments to the CF methodology described in previous testimony, as
5 well as necessary adjustments for hydro pricing, GHG benefits, and third-party loads
6 as described in this testimony. As detailed in Exhibit 307, the Company's total
7 estimated benefit for the April 2019 through March 2020 time period is \$11.9 million,
8 or \$0.55 million on an Oregon jurisdictional basis.

9 The Company's estimate of EIM benefits is reflected as an offset to forecast
10 NPSE for the March Forecast, as shown in Exhibit 301. The Company has also
11 included the estimate of EIM benefits as an offset to forecast NPSE for the October
12 Update, as shown in Exhibit 302. The EIM benefits estimate include in the initial
13 October Update filing was \$4.5 million and base NPSE totaled \$387.5 million. With
14 the updated EIM benefits estimate of \$11.9 million, normalized NPSE included in the
15 October Update totals \$380.0 million.

16 **Q. As it gains more experience operating within the EIM, are there any other areas**
17 **of the benefits forecast methodology the Company will continue to investigate**
18 **for possible use in future filings?**

19 A. Yes. The Company will continue to evaluate the potential need to normalize the
20 forecast for any anomalies that may have existed during the historical base period.
21 These potential adjustments could correct for abnormal factors such as weather,
22 water, and market conditions.

23 **II. PER-UNIT COST CALCULATION AND QUANTIFICATION OF THE REVENUE**
24 **REQUIREMENT IMPACT.**

25 **Q. How does the 2019 March Forecast of NPSE compare to last year's March**
26 **Forecast of NPSE?**

1 A. The 2019 March Forecast of NPSE is \$398.1 million, or \$16.2 million more than the
2 2018 March Forecast of NPSE of \$382.0 million.⁵ The initial March Forecast proposed
3 a revenue increase of \$1.07 million or a 1.94 percent increase. If the March Forecast
4 and October Update are approved as proposed in this filing, the 2019 composite APCU
5 (both the October Update and March Forecast components) will result in a revenue
6 increase of \$0.88 million or a 1.59 percent increase, to become effective June 1, 2019.

7 **Q. What is the revised March Forecast unit cost per megawatt-hour (“MWh”) for**
8 **this filing?**

9 A. Exhibit 301 shows the normalized annual sales at the customer level for the April 2019
10 through March 2020 test period of 14,836,820 MWh (line 48). Based upon test period
11 sales, the cost per-unit for the March Forecast is \$26.83 per MWh (\$398.1 million /
12 14.837 million MWh = \$26.83 per MWh) (lines 47, 48, and 49).

13 **Q. How does this year’s March Forecast unit cost per MWh compare to last year’s**
14 **March Forecast unit cost per MWh?**

15 A. The 2018 March Forecast unit cost per MWh was \$25.53 per MWh (\$382.0 million /
16 14.962 million MWh = \$25.53 per MWh), compared to this year’s March Forecast unit
17 cost of \$26.83 per MWh.

18 **Q. Please describe the calculation necessary to determine the March Forecast rate.**

19 A. Exhibit 304 steps through the Commission-specified method of calculating the March
20 Forecast rate, pursuant to Order No. 08-238. Lines 1-3 show the calculation for the
21 October Update unit cost of \$25.61 per MWh. Lines 4-6 show the calculation for the
22 March Forecast unit cost of \$26.83 per MWh. Line 7 reflects the March Forecast unit
23 cost minus the October Update unit cost multiplied by the March Forecast Normalized
24 Sales (line 6 minus line 3 multiplied by line 4). Line 8 is the allocated amount (95
25

26 ⁵ Final NPSE as shown in Exhibit No. 2 of the 2018 APCU Settlement Stipulation, Docket No.
UE 333 (May 1, 2018).

1 percent) that is allowed for the March Forecast rate. Line 9, the Forecast Change
2 Allowed, is calculated by multiplying line 7 by line 8. Line 10 divides line 9 by line 4 to
3 calculate the March Forecast rate of \$1.16 per MWh.

4 **Q. How does the \$1.16 per MWh compare to the March Forecast rate that resulted**
5 **from last year's computation?**

6 A. The March Forecast rate for last year's April 2018 through March 2019 test period was
7 negative \$0.59 per MWh, as compared to this year's April 2019 through March 2020
8 test period rate of \$1.16 per MWh, an increase of \$1.75 per MWh.

9 **Q. How is the revenue requirement for the March Forecast calculated using the**
10 **March Forecast rate unit cost of \$1.16 per MWh?**

11 A. The revenue requirement for the March Forecast is calculated by multiplying the March
12 Forecast rate of \$1.16 per MWh by the loss-adjusted Oregon jurisdictional sales for
13 the April 2019 through March 2020 test period of 686,328.238 MWh, resulting in a
14 revenue requirement of approximately \$0.80 million, as shown on page 2 of Exhibit
15 305, line 1. Under the current March Forecast rate of negative \$0.59 per MWh, the
16 revenue requirement included in Oregon customer rates is approximately negative
17 \$0.42 million. As such, the proposed 2019 March Forecast rate of \$1.16 per MWh will
18 result in a revenue requirement increase of \$1.22 million compared to what is currently
19 being collected through Oregon customer rates.

20 **Q. Did the Company revise the revenue requirement for the October Update?**

21 A. Yes. The Company revised the revenue requirement for the October Update to align
22 with the loss-adjusted sales that were used for the March Forecast filing and to update
23 estimates of EIM benefits and costs.

24 The practice of updating the loss-adjusted sales for the October Update
25 revenue requirement is consistent with the method applied in the last seven APCU
26 filings in Docket Nos. UE 242, UE 257, UE 279, UE 293, UE 301, UE 314, and UE

1 333. The April 2019 through March 2020 loss-adjusted Oregon jurisdictional sales for
2 the October Update were 680,879.846 MWh, whereas the loss-adjusted Oregon
3 jurisdictional sales for the March Forecast are 686,328.238, an increase of 5,448.392
4 MWh. The change in the loss-adjusted sales increases the October Update revenue
5 requirement from an initial decrease of \$9,979 to \$26,421, an increase of \$36,400.

6 This increase is more than offset by the revised forecast of EIM benefits and
7 revised EIM revenue requirement from the amounts included in the initial October
8 Update filing. The final revenue requirement associated with the October Update is a
9 decrease of \$0.34 million, or 0.61 percent. Exhibit 305 contains the revised October
10 Update revenue requirement.

11 **III. RATE IMPLEMENTATION**

12 **Q. What method of allocation are you proposing to spread the revenue requirement**
13 **increase associated with the 2019 APCU to the various customer classes?**

14 A. The Company proposes to allocate the revenue requirement associated with the 2019
15 APCU according to the revenue spread methodology agreed upon in the 2018
16 Stipulation. The 2018 Stipulation established a revenue spread methodology whereby
17 the APCU revenue requirement is allocated to individual customer classes on the basis
18 of normalized jurisdictional forecasted sales at the generation level for the test period.
19 Additionally, any rate increases resulting from application of this revenue spread
20 methodology as applied to a customer class will be capped at 3 percent above the
21 overall average rate increase on a percentage of total revenue basis. In this case, the
22 overall average rate change as a percentage of total revenue is an increase of 1.59
23 percent; therefore, any rate increases applied to individual customer classes will be
24 capped at 4.59 percent. The proposed revenue spread resulting from the application
25 of the stipulated methodology is shown in Exhibit 305.
26

1 **Q. What is the overall revenue impact of this year's combined October Update and**
2 **March Forecast compared to last year's combined October Update and March**
3 **Forecast using the rate spread methodology described above?**

4 A. Exhibit 306 provides a summary of the revenue change resulting from this year's
5 combined October Update and March Forecast as compared to current revenue. As
6 can be seen on line 14 of Exhibit 306, the overall revenue impact of this year's
7 combined October Update and March Forecast is an increase of \$0.88 million or 1.59
8 percent overall. The \$0.88 million increase reflects a decrease of \$0.34 million in base
9 rate revenues associated with the October Update and a \$1.22 million increase in
10 Schedule 55 revenues associated with the March Forecast, as compared to what is
11 currently included in Oregon customers' rates related to the 2018 APCU.

12 **Q. Does the Company intend to provide supporting workpapers for the 2019 March**
13 **Forecast to Staff and CUB?**

14 A. Yes. Idaho Power will provide its supporting workpapers to Staff and CUB within five
15 business days of filing the 2019 March Forecast.

16 **Q. Does this conclude your testimony?**

17 A. Yes, it does.
