LIST OF EXHIBITS

Exhibit SC/201: PacifiCorp Response to Sierra Club Data Request 5.2

1. Overview

1

2	Q.	What is the focus of your rebuttal testimony?
3	A.	The focus of my rebuttal testimony is on Mr. Owen's Reply Testimony regarding Jim
4		Bridger coal fuel costs. I also briefly address Mr. Mitchell's Reply Testimony on
5		Extended Day Ahead Market ("EDAM") and AURORA modeling. Mr. Owen's Reply
6		addressed several other issues I raised, particularly regarding new coal supply agreement
7		("CSAs") for coal supplies in Utah. While my Rebuttal does not specifically address Mr.
8		Owen's Reply on several of these issues, I still support my initial findings and
9		recommendations.
10	2.	Bridger Coal Company ("BCC") Scenario Analysis in the 2023 Long Term Fuel
11		Supply Plan ("LTFSP")
12	Q.	Can you reiterate some key features of PacifiCorp's scenario analysis in its LTFSP?
13	A.	Yes. PacifiCorp ("Company") compared the total net power costs ("NPC") cost of six
14		different fueling scenarios. Of these, the Company's preferred option was Scenario 5/6,
15		which In my opening
16		testimony, I concluded that Scenario 4 would be a more prudent option (of those that
17		PacifiCorp studied) since it includes a lower volume of BCC coal, and therefore reduces
18		PacifiCorp customers' exposure to one of the Company's most costly coal plants. It also
19		reduces the risk of exposing customers to fixed mining costs that could become stranded
20		assets.
21	Q.	According to PacifiCorp's most recent analysis, which of these scenarios was lower
22		in cost from a Present Value Revenue Requirement ("PVRR") perspective?
23	A.	If PacifiCorp's analysis is taken at face value, then Scenario 5/6 is about \$
24		(PVRR) lower in cost than Scenario 4.2 However, this does not necessarily mean it is the
25		least-cost, least-risk scenario overall. As I alluded to, Scenario 5/6 exposes PacifiCorp
26		customers to more generation from Jim Bridger, and the risks associated with that

² PAC/500 at Owen/36:3-4.

¹ See Reply Test. of James Owen at Owen/37:16-20 [hereinafter "PAC/500"] (describing Scenario 4 as a low production scenario, representing the minimum operating level at the Jim Bridger mine).

- generation. Additionally, there may be other potentially lower cost scenarios that
 PacifiCorp did not study, such as retiring the Jim Bridger plant and Bridger mine before
 3 2029 or operating the plant and mine on a seasonal basis.
- Q. Do you think PacifiCorp's analysis suggesting Scenario 5/6 is lower in cost than
 Scenario 4 (or other unstudied options) should be taken at face value?
- 6 No. As PacifiCorp conceded in its Reply Testimony, the Company's original LTFSP A. 7 analysis contained a significant error that upon correction resulted in a much smaller cost 8 differential between Scenario 4 and Scenario 5/6. More specifically, the cost differential 9 (PVRR) to \$ (PVRR) after the correction was shrank from S 10 made. In other words, PacifiCorp's original analysis contained an error with a magnitude (PVRR). It is conceivable there are other errors in PacifiCorp's 11 of at least \$ analysis of a similar magnitude that remain uncorrected and would further shrink the cost 12 13 differential to \$0 or less. As I will discuss below, there were several other potential errors that I identified in Opening Testimony that PacifiCorp did not correct in its Reply. 14

15 Q. Can you further describe the error PacifiCorp made in its original LTFSP analysis?

A. According to PacifiCorp's Reply Testimony: "PacifiCorp has identified an error in the reporting of market purchases and sales in the 2023 Fuel Plan results, which made wholesale sales appear to be a larger portion of the benefits in Scenario 5 than was actually the case." In other words, the benefits from wholesale sales in Scenario 5 were erroneously inflated, an issue that I raised in Opening Testimony.

21 Q. How does PacifiCorp characterize these benefits in its corrected analysis?

A. PacifiCorp states that in the corrected analysis, "approximately 11 percent of the incremental Jim Bridger coal-fired generation in Scenario 5 relative to Scenario 4 took the form of additional market sales, including 21 percent in 2024." Thus, some amount of the incremental generation from the Jim Bridger plant under Scenario 5 is still going towards off-system, wholesale sales, rather than serving PacifiCorp's customers.

³ PAC/500 at Owen/39:13-15.

⁴ PAC/500 at Owen/39:18-20.

Q. Do you agree with PacifiCorp's characterization of Sierra Club's position regarding off-system sales?

A. No. PacifiCorp states that Sierra Club "cherry picks NPC components to support their flawed narrative" and insinuates that Sierra Club sought to remove wholesale sales from the NPC analysis. None of this is true. Sierra Club has always recognized that wholesale purchases and sales should be part of a comprehensive NPC analysis. However, Sierra Club remains concerned that PacifiCorp's analysis – whether intentional or not – may be skewing the results towards a certain preferred outcome (i.e., Scenario 5/6). One factor, among others, Sierra Club identified that could skew the results would be if PacifiCorp is using different assumptions between scenarios regarding the quantity of wholesale purchases and sales. This concern was evidently warranted given the error that PacifiCorp acknowledged, which was specifically related to its treatment of wholesale sales. Sierra Club remains concerned there are still other errors or inconsistencies inflating the benefits of Scenario 5.

Q. What other errors or inconsistencies in the LTFSP remain uncorrected?

- A. I identified several potential categories of errors or inconsistencies in my Opening Testimony (page 31 line 25 through page 32 line 10), including:
 - the inclusion of 2023 costs,
 - an unexplained change in "other generation" between scenarios that is unrelated to Jim Bridger's output,
 - inconsistent coal pricing assumptions between regulatory filings, especially after 2025, and
 - the inability to consider new generation resources in the later years.

It is not clear to me that any of these (let alone all of them) were actually addressed in PacifiCorp's correction. As one example, my Opening Testimony mentioned the fact that the LTFSP scenario comparison included costs from 2023, even though these costs are irrelevant for decision-making in 2024 and beyond. In PacifiCorp's original analysis, the

⁵ PAC/500 at Owen/40:18-19.

1	2023 costs inflated the differential between Scenario 4 and 5 by \$ In the
2	corrected analysis, this discrepancy appears to have been reduced to about \$
3	PacifiCorp's Reply Testimony did not provide any sound rationale for continuing to
4	include these 2023 costs in its corrected analysis, other than the fact that the Integrated
5	Resource Plan ("IRP") also starts in 2023. The fact that the IRP's time horizon starts in
6	2023 does not change the fact that 2023 costs should be excluded when evaluating a
7	fueling plan for 2024 or identifying prudent costs for 2024 TAM recovery. PacifiCorp
8	also provides no explanation for why 2023 costs differ between Scenarios 4 and 5, even
9	though the quantities of fuel received are identical in the analysis for that year (and
10	presumably cannot be changed mid-year anyways).
11	By the same token as the 2023 costs (which should definitely be excluded from
12	consideration in the 2024 TAM), the PVRR calculation that PacifiCorp uses to compare
13	the scenarios in the LTFSP also includes costs for years beyond 2024 (i.e., 2025-2029)
14	which are arguably not relevant to the 2024 TAM. In both PacifiCorp's original analysis
15	and its correct analysis, I estimate that these future post-2024 costs account for about
16	of the PVRR difference between Scenarios 4 and 5.
17	As another example that I addressed in my Opening Testimony, there was an unexplained
18	in "other generation" (described as "hydro, wind, etc.") for Scenario 5 relative to
19	Scenario 4. This was true even though there was from Jim Bridger in
20	Scenario 5, which
21	
22	. In PacifiCorp's original analysis I estimate that this unexplained
23	in other generation from Scenario 4 to 5 inflated the cost differential by at least
24	in 2024 alone. PacifiCorp's corrected analysis appears to have partially
25	resolved this issue, since the amount of "other generation" is only
26	Scenario 5. However, this is still a problematic assumption because it suggests that the
27	increased generation from Jim Bridger output in Scenario 5 only ever displaces thermal
28	resources or market purchases, and never displaces other generation (e.g., hydro, wind

 $^{^6}$ Confidential Workpaper Accompanying Reply Test. of James Owen (PAC/500), "Total NPC MMBTU MWH (Corrected).xlsx."

curtailment, etc.). For this reason, I still would have expected Scenario 5 to have a 1 2 amount of other generation. Finally, as I pointed out in my Opening Testimony, there are coal cost inputs that are 3 inconsistent or vary inexplicably between the workpapers PacifiCorp provided. For 4 5 instance, the BCC \$/ton assumptions used in the LTFSP for Scenario 5 is noticeably 6 lower than those provided in PacifiCorp's Compliance Filing to Order No. 22-389, ⁷ even 7 though the total tons delivered is identical in each year. If the cost per ton assumptions 8 were adjusted to be consistent with the Compliance Filing, I estimate that this would 9 increase Scenario 5's costs by about \$. Furthermore, the incremental coal costs 10 in Scenario 5 of the LTFSP inexplicably in years 2027 and 2028. 11 Q. What do you think the PVRR cost differential between Scenarios 4 and 5 would be 12 if these other corrections were made? 13 A. If other corrections were made, I believe the PVRR cost differential between Scenarios 4 14 and 5 would be *de minimis*. In other words, I think it is reasonable to consider Scenarios 15 4 and 5 as roughly on par with each other from a cost perspective. Meanwhile, Scenario 4 would carry much less risk exposure to the costs of Jim Bridger for PacifiCorp 16 17 customers. 18 Have you estimated what the 2024 NPC cost difference would be under Scenario 4? Q. 19 A. Yes. Based on PacifiCorp's corrected analysis, Scenario 4's 2024 NPC costs appear to be 20 higher than Scenario 5. However, this increased cost does not take into 21 account any of the potential corrections I mentioned earlier. It also carries lower risk 22 exposure to generation from Jim Bridger and fixed mining costs. For comparison, this increase in costs is equivalent to about \(\begin{align*} \text{\text{of PacifiCorp's estimated wholesale} \) 23 transactions. In other words, it would be similar to PacifiCorp underestimating wholesale 24 power prices by about \$\text{MWh}. It is also worth noting that, according to PacifiCorp, 25 26 21 percent of the incremental Jim Bridger generation in 2024 under Scenario 5 goes 27 towards additional market sales. I estimate that this contributes \$ million in benefits

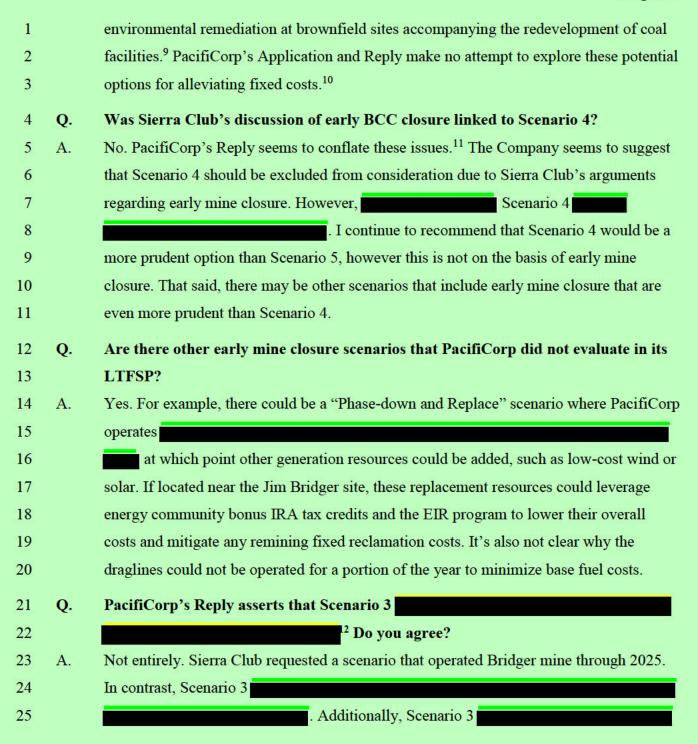

⁷ Provided in PacifiCorp Response to Sierra Club Data Request 1.22, Ex. SC/104.

to Scenario 5. Thus, if these incremental wholesale sales did not materialize, the NPC of
 Scenarios 4 and 5 would be virtually identical.

3. Costs Associated with Early Mine Closure

- Q. PacifiCorp's Reply asserts that "Sierra Club errantly compares the cost of closing
 BCC in 2023 with calendar year 2023 costs in other scenarios that assume BCC will
 operate through 2029. Sierra Club fails to recognize that prudently incurred costs
 for mine investment and reclamation costs are recovered during the mine's
 operating life. Operating costs will increase when these fixed costs are expensed or
 funded over a shorter period of time." Do you agree?
- 10 A. No. I do agree that operating costs will increase when fixed costs are expensed over a 11 shorter period of time. However, and unfortunately, neither PacifiCorp's Reply nor its 12 LTFSP delineated what costs from future years (i.e., 2024-2029) it considers fixed and would therefore need to be recovered in 2023 if BCC closed early. Thus, I was unable to 13 14 assess the impacts of early closure on fixed cost recovery. Based on my preliminary 15 analysis comparing Scenarios 3 and 5, it appears that PacifiCorp considers over 16 of BCC costs in 2024-2029 to be fixed. However, with the possible exceptions of reclamation and depreciation costs, it's not clear to me what other categories of future 17 costs in these years could be considered "fixed" at the time of PacifiCorp's application. 18
- Q. Presuming reclamation and depreciation costs make up the majority of fixed costs in 2024 through 2029, would those necessarily need to be recovered immediately in the case of an early mine closure?
- A. No. There may be other means of recovering these costs more gradually, such as through a regulatory asset with a lifetime through 2029. Additionally, it is possible that the Energy Infrastructure Reinvestment ("EIR") program, which was authorized through the Inflation Reduction Act ("IRA") and provides low-cost financing to facilitate the retooling, repowering, repurposing, or replacing of fossil infrastructure to reduce greenhouse gas emissions, could be leveraged to reduce some of these fixed costs. For example, the director of the Loans Program Office at the U.S. Department of Energy,

4. Annual LTFSP Undate

3	4.	Annual LTFSF Update
4	Q.	In PacifiCorp's Reply Testimony, the Company disagreed with your
5		recommendation to update the LTFSP every year, rather than every two years. How
6		do you respond?
7	A.	I stand by my earlier recommendation to update the LTFSP every year. PacifiCorp argues
8		that every two years is appropriate since that would coincide with its IRP cycle.
9		PacifiCorp asserts that "this makes sense because (1) the IRP relies upon data developed
10		for the long-term fuel plan, and (2) the long-term fuel plan relies upon the resource mix
11		in the preferred portfolio from the biennial IRP filing." 13 Yet, in the current IRP cycle,
12		the IRP did not rely on the LTFSP, because it was not completed until after the IRP was
13		finalized. And while the LTFSP may be informed by the resource mix in the IRP
14		preferred portfolio, the IRP update occurs on the off years, which should also inform a
15		yearly LTFSP.
16		Perhaps more importantly, an annual update is necessary to coincide with the TAM cycle,
17		when cost recovery for Jim Bridger fuel is decided. Since there is no CSA that the
18		Commission can review for BCC fuel, the LTFSP appears to be the only way the
19		Commission can evaluate whether BCC costs included in the TAM are appropriate.
20		Moreover, as PacifiCorp acknowledged, a significant error was made in its original 2023
21		LTFSP analysis, which highlights the need for more scrutiny rather than less.
22		Importantly, the Commission gave extensive guidance in the 2023 TAM proceeding
23		(Order No. 22-389) on how and when PacifiCorp should provide its analysis of newly
24		executed CSAs. Because there is technically no CSA for BCC coal fuel, PacifiCorp is
25		able to evade these requirements for this particular fuel source. Thus, in addition to
26		updating the LTFSP on an annual basis, I further recommend that the guidelines provided
27		in Order No. 22-389 for CSA analysis also apply to the LTFSP analysis.

-

¹³ PAC/500 at Owen/41:13-15.

5. EDAM Participation

- Q. What was PacifiCorp's response to your recommendations regarding oversight of
 EDAM participation?
- 4 A. PacifiCorp dismissed my recommendations as "irrelevant" to the 2024 TAM because EDAM is scheduled for implementation in 2025. 14
- 6 Q. Do you agree?

1

14

A. No. PacifiCorp has publicly announced its intention to begin EDAM participation in 2024, not 2025. ¹⁵ If the Company does indeed plan to participate in 2024, then the issues I raised are highly relevant to the 2024 TAM. If PacifiCorp has, in fact, delayed its intended participation date to 2025 then the Company should clarify this. Even if the Company has delayed until 2025, I still think it would be warranted for the Commission to begin considering the EDAM oversight issues, and their interaction with future TAM cycles, well in advance of PacifiCorp's participation.

6. Modeling Minimum Take Requirements

- 15 Q. Mr. Mitchell's Reply suggests that the Commission previously rejected Sierra
 16 Club's argument that "the Company should not model minimum take
 17 requirements." Is that true?
- 18 A. No. Order No 22-389 confirms that the Commission is indeed interested in analysis of 19 scenarios without minimum take requirements. In fact, the Commission directed 20 PacifiCorp to perform such analysis for its Hunter contracts in this proceeding. Sierra 21 Club is encouraged that PacifiCorp did perform an analysis with varying levels of 22 minimum take requirements for most of the new or amended CSAs presented in its 23 application. However, this was not universally the case since PacifiCorp did not perform 24 such analysis on the speculative Black Butte CSA that was originally included in its 2024 25 NPC calculations. Now that the Black Butte CSA has been removed, Sierra Club has 26 fewer concerns in this regard.

Witness: Ed Burgess

Rebuttal Testimony of Ed Burgess On Behalf of Sierra Club

Exhibit SC/201
PacifiCorp Response to Sierra Club Data Request 5.2

UE-420 / PacifiCorp August 14, 2023 Sierra Club Data Request 5.2

Sierra Club Data Request 5.2

Please refer to Tapping into DOE's \$250B of Loan Authority for Projects that Reinvest in US Clean Energy Infrastructure (available at https://www.utilitydive.com/news/department-of-energy-doe-250-billion-loan-authority-solar-wind-storage-nuclear-clean-energy/653530/), wherein Jigar Shah, the director of the Loans Program Office at the U.S. Department of Energy, describes using Energy Infrastructure Reinvestment financing to finance remediation of several on-site coal ash ponds at a former coal plant site that is being repurposed for clean energy.

- (a) In quantifying the assumed reclamation costs at the Bridger coal mine under Scenarios 1 through 6 in the 2023 Jim Bridger Long Term Fuel Supply Plan, please explain whether PacifiCorp factored in potential cost savings from using U.S. Department of Energy loans made available under the Energy Infrastructure Reinvestment program.
- (b) If the answer to SC 5.2(a) is no, please explain why not.

Response to Sierra Club Data Request 5.2

- (a) No.
- (b) The Company is evaluating the United States (U.S.) Department of Energy (DOE) loan program for future use. The program has a lengthy and complex approval process that takes approximately one year. PacifiCorp is also evaluating its mortgage to ensure that the U.S. DOE loans can be secured and are pari-passu to other First Mortgage Bonds.
