**Re: Docket UM 1355**

Enclosed for filing in the above captioned docket are the original and five copies of Idaho Power Company's Direct Testimony of John Carstensen. A copy of this filing was served on all parties to this proceeding as indicated on the attached Certificate of Service.

Please contact me with any questions.

Very truly yours,

Adam Lowney

BEFORE THE PUBLIC UTILITY COMMISSION  
OF OREGON

UM 1355

IN THE MATTER OF )  
 )  
PUBLIC UTILITY COMMISSION OF )  
OREGON )  
 )  
INVESTIGATION INTO FORECASTING )  
FORCED OUTAGE RATES FOR )  
ELECTRIC GENERATING UNITS. )

**IDAHO POWER COMPANY**  
**DIRECT TESTIMONY**  
**OF**  
**JOHN CARSTENSEN**

**July 16, 2010**

1           **Q.     Please state your name, business address and present position with**  
2 **Idaho Power Company (the Company).**

3           A.     My name is John Carstensen. I am employed by Idaho Power Company  
4 (“Idaho Power” or “Company”) as a Project Engineering Leader in the Power Supply  
5 department. My business address is 1221 West Idaho Street, Boise, Idaho 83702.

6           **Q.     Please describe your education background.**

7           A.     I received a Bachelor of Science degree in Mechanical Engineering from  
8 Brigham Young University.

9           **Q.     Please describe your work experience?**

10          A.     In April 1991, I accepted a position as Engineer with Idaho Power Company  
11 in the Generation Engineering Department. In December 1994, I changed departments  
12 from Generation Engineering to Thermal Production. I am currently an Engineering Project  
13 Leader in the Joint Projects. I am responsible for the operations, maintenance, and  
14 engineering for Idaho Power’s three co-owned coal fired facilities (Jim Bridger, Boardman,  
15 and North Valmy). I am the Idaho Power representative on the Ownership and Engineering  
16 committees for these facilities.

17          **Q.     What is the purpose of your testimony?**

18          A.     The purpose of my testimony is to describe the Company’s methodology for  
19 calculating Forced Outage Rates (FOR) for its coal-fired generating units. I will also respond  
20 to issues raised in testimony filed by the Industrial Customers of Northwest Utilities (“ICNU”)  
21 relating to its proposed collar mechanism for excluding extreme outages from the forecast  
22 outage rate.

23

24

1           **Q.     Please explain how the Company calculates its FOR and EFOR.**

2           A.     The company uses the North American Electric Reliability Council (NERC)  
3     Generating Availability Data System (GADS) methodology as indentified in Appendix F –  
4     Performance Indexes and Equations from the GADS Data Reporting Instructions – January  
5     2010. The formulae used by the Company are as follows:

6   FOH  
7     FOR =  $\frac{\text{FOH}}{\text{FOH} + \text{SH} + \text{Synchronous Hrs} + \text{Pumping Hrs}}$  x 100%  
8   FOH + SH + Synchronous Hrs + Pumping Hrs  
9

10  
11     The EFOR is calculated as follows:

12  
13   FOH + EFDH  
14     EFOR =  $\frac{\text{FOH} + \text{EFDH}}{\text{FOH} + \text{SH} + \text{Synchronous Hrs} + \text{Pumping Hrs} + \text{EFDHRS}}$  X 100%  
15   FOH + SH + Synchronous Hrs + Pumping Hrs + EFDHRS  
16

- 17  
18     FOR – Forced Outage Rate  
19     FOH – Forced Outage Hours  
20     SH – Service Hours  
21     EFOR – Equivalent Forced Outage Rate  
22     EFDH – Equivalent Forced Derated Hours  
23     EFDHRS – Equivalent Forced Derated Hours During Reserve Shutdowns  
24

25     Although the NERC method includes Synchronous Hours, EFDHRS, and Pumping Hours,  
26     the Company's operating partners do not report these values to Idaho Power. As I discuss  
27     in more detail below, the Company is a co-owner of three different coal-fired plants. Idaho  
28     Power is not the operator of these plants; however it participates in the operational decision-  
29     making of how these plants are run. Therefore, the Company relies on its operating  
30     partners to provide it with the data used to calculate its outage rates. Despite the lack of the  
31     Synchronous Hours, EFDHRS, and Pumping Hours, the exclusion of these values from the  
32     FOR and EFOR calculations do not significantly change the outcome of the analysis.

33  
34

1           **Q.     Please explain how the Company currently accounts for extreme events**  
2 **when calculating its EFOR for coal units.**

3           A.     When a particular year includes a forced outage that is extraordinary, the  
4 Company excludes the actual operating data from the months of the extreme event. To  
5 normalize the EFOR the Company then replaces those values with the EFOR for that  
6 particular plant from the last planning period.

7           **Q.     Does the Company currently use the methodology described above for**  
8 **planning and ratemaking purposes?**

9           A.     Yes. The Company currently uses this methodology when preparing its  
10 Operations Plan. It is also the methodology used by the Company when determining its  
11 outage rates for purposes of forecasting its net variable power supply expenses.

12           **Q.     Do you believe this methodology produces the Company's best**  
13 **estimate for calculating an EFOR for units that experience an extreme event?**

14           A.     Yes. It utilizes the most recent generation information that is available to  
15 properly forecast the EFOR for the next planning period. As discussed below, using long-  
16 term historical data presents significant problems that can be avoided through the use of  
17 more recent operating data.

18           **Q.     Please explain the proposal set forth by the Industrial Customers of**  
19 **Northwest Utilities ("ICNU") relating to the exclusion of extreme events from the FOR**  
20 **calculation for coal units.**

21           A.     ICNU witness Randy Falkenberg proposes that all extreme events—defined  
22 as events falling outside the 90<sup>th</sup> and 10<sup>th</sup> percentile of NERC data—be replaced by a 20-  
23 year historical average of the unit's FOR. After this proposal, the Commission also  
24 proposed a collar mechanism that used the same method to exclude extreme events, only

1 instead of replacing those excluded events with a 20-year historical average, the  
2 Commission's collar replaces those excluded events with the historical average based on  
3 the life of the plant.

4 **Q. Was ICNU's proposal designed specifically for PacifiCorp?**

5 A. Yes. Mr. Falkenberg's proposal was based on an analysis he specifically  
6 performed for PacifiCorp's generating fleet, which he mentioned in his testimony.

7 **Q. Are there any differences between Idaho Power's coal generating fleet  
8 and PacifiCorp's?**

9 A. Yes. According to PacifiCorp's testimony in this docket, PacifiCorp has 26  
10 coal plants. PacifiCorp's service area also extends to six different states. Idaho Power, on  
11 the other hand, co-owns three plants: the Jim Bridger Power Plant, which has four  
12 generating units and is 36 years old; the Boardman Power Plant, which has one generating  
13 units and is 30 years old; and the North Valmy Power Plant, which has two generating units  
14 and is 29 years old.

15 As noted above, Idaho Power is not the sole owner and operator of these plants.  
16 Idaho Power is the minority co-owner of the Jim Bridger Power Plant with PacifiCorp, it is the  
17 minority co-owner of the Boardman Power Plant with Portland General Electric, and it co-  
18 owns the North Valmy Power Plant with NV Energy. Idaho Power is also subject to two  
19 state regulatory commissions—Oregon and Idaho. The following table further illustrates the  
20 differences between the Idaho Power and PacifiCorp fleet. The PacifiCorp data was taken  
21 from Staff's testimony in this docket.<sup>1</sup>

22

---

<sup>1</sup> Staff/300, Brown/11, I. 16.

Size of Unit (MW)	Number of Idaho Power Units	Idaho Power Average Age (Years)	Number of PacifiCorp Units	PacifiCorp Average Age (Years)
0-99	–	–	1	54
100-199	–	–	5	48
200-299	2	27	3	40
300-399	–	–	4	34
400-599	5	33	11	31
600-799	–	–	2	24

1

2           The fact that Idaho Power does not solely own and operate these plants is important  
3 because each operating partner has their own philosophy on maintenance and operating  
4 procedures, outage schedules, routine replacement and repair, capital expenditures and  
5 upgrades. Idaho Power works closely with these operating partners to ensure that the  
6 plants are run in a safe, efficient, and economical manner. However, because it is a co-  
7 owner it cannot dictate the terms of operation and is limited in its ability to influence plant  
8 operation. As noted above, Idaho Power also relies on the actual plant operator to provide it  
9 with the data necessary to perform its outage rate calculations for planning and ratemaking  
10 purposes.

11           **Q. Both the ICNU and the Commission proposals use long-term historical**  
12 **averages as replacement values for excluded outages. Do you have any concerns**  
13 **about the use of long-term historical averages to forecast future outage rates?**

14           A. Yes. Over time the physical and operational characteristics of the Company's  
15 thermal fleet have changed. These changes include the implementation of new

1 maintenance practices designed to ensure optimal plant performance. The maintenance  
2 procedures used at the Company's plants 20 or 30 years ago, when the plants were much  
3 younger, are not the same practices used today. For example, as the plants age, boiler  
4 tubes start to thin and experience fatigue and fans, motors, and pumps start to wear. This  
5 wear and tear requires the operator of the plant to modify its practices to ensure that the  
6 necessary maintenance occurs with minimal disruption.

7 Also, today our plants are undergoing significantly greater large-scale equipment  
8 replacement. In the past, the industry assumed that a coal-fired plant had a 30 to 35 year  
9 life. As plants now start to near the end of this projected life, plant operators have realized  
10 that the assumed 30 to 35 year life was not realistic and that with proper maintenance and  
11 replacement of worn equipment the life of these assets could be extended. This realization  
12 has lead plant operators to start large replacement programs of worn items, such as  
13 sections of boilers, turbines, or generators. These replacement programs have caused  
14 scheduled or planned outages to change and this, in turn, causes forced outage rates to  
15 change. These large-scale replacement projects were much less common 20 or 30 years  
16 ago.

17 Prudent utility practices also have changed over time to account for an aging national  
18 fleet of coal fired plants.

19 **Q. What do these changes mean for using long-term historical average to**  
20 **forecast future outage rates?**

21 A. Because of these changes I do not have confidence in the reliability of the  
22 entire historical outage rate data. The purpose of this docket is to determine the method  
23 that best predicts future outage rates. Both the ICNU and Commission proposals assume  
24 that outage data from 20 years ago is an accurate predictor of the outage rate a plant will

1 experience in the next year. I disagree. For instance, data from 20 years ago is not  
2 necessarily predictive of next year's outage rate because the data from 1990 may have  
3 been collected in a different manner (e.g. the plant operator may have characterized  
4 outages differently), the plant was likely governed by a different operating philosophy (e.g.  
5 the operator may have worked to minimize scheduled maintenance outages which  
6 increases forced outages), and the maintenance procedures 20 years ago were different  
7 than those used today. The Company has no way to verify that the data from 20 or 30 years  
8 ago is reliable and substantially the same data that would have been collected using today's  
9 maintenance and operational standards.

10 Idaho Power's method, on the other hand, utilizes much more recent historical data  
11 to forecast future outage rates. This recent data is reliable because it was collected under  
12 substantially the same operational and maintenance practices as the forecasting period.

13 **Q. Does this conclude your testimony?**

14 **A. Yes it does.**

1 **CERTIFICATE OF SERVICE**

2 I hereby certify that I served a true and correct copy of the foregoing document in  
3 Docket UM 1355 on the following named person(s) on the date indicated below by email  
4 and first-class mail addressed to said person(s) at his or her last-known address(es)  
5 indicated below.
