Attn: Filing Center

Re: Advice No. 18-011/UE 352—Schedule 202—PacifiCorp's 2019 Renewable Adjustment Clause

In compliance with ORS 757.205, OAR 860-022-0025, OAR 860-022-0030, and ORS 757.210, PacifiCorp, d/b/a Pacific Power submits for filing with the Public Utility Commission of Oregon (Commission) the enclosed Schedule 202 Renewable Adjustment Clause Supply Service Adjustment (Schedule 202), of the company's Tariff P.U.C. OR No. 36, which sets forth all rates, tolls, charges, rules and regulations applicable to electric service in the State of Oregon. The company respectfully requests an effective date of October 1, 2019 for these tariff sheets.¹

PacifiCorp makes this filing per the settlement agreement approved by the Commission in docket UE 339.

The purpose of this filing is to implement Schedule 202 rates to recover costs associated with the repowering of certain PacifiCorp wind resources as described further below and in the enclosed supporting testimony, and to make housekeeping changes to Schedule 202 to remove outdated language relating to Senate Bill 408.

A. Description of Filing

In Order No. 07-572, the Commission approved a Renewable Adjustment Clause (RAC) for PacifiCorp, under Senate Bill 838, enacted on June 6, 2007. The Commission directed PacifiCorp to file Schedule 202, to be effective January 1, 2008. In Advice No. 07-027, PacifiCorp filed Schedule 202 in compliance with Order No. 07-572. Schedule 202 provides that the company file any proposed charges under Schedule 202 by April 1 of each year, as necessary. These April 1 filings include new eligible renewable resources and associated transmission and are also used to update charges already included in the schedule.²

¹ As discussed below, the company is proposing a second rate change effective on December 1, 2019. PacifiCorp proposes to submit a compliance filing with revised tariff sheets for rates effective on December 1, 2019 by November 1, 2019.

² Schedule 202 was most recently revised in April 2013 to remove reference to PacifiCorp's Schedule 33. Schedule 33, Klamath Basin Irrigation and Drainage pumping, was canceled on April 16, 2013 at the conclusion of the seven year transition rate period for these irrigation customers.

Beginning in 2018, PacifiCorp began upgrading or "repowering" 900.1 MW of company-owned and installed wind capacity through the addition of longer blades and new technology to generate more energy in a wider range of wind conditions.³ These upgrades increase output of the company's wind facilities by 26.7 percent, on average, extend the operating life of the facilities and allow the facilities to requalify for federal production tax credits. This filing seeks approval to include the costs associated with these facilities, expected to come online by December 31, 2019, through the company's RAC.

In docket UE 339, PacifiCorp's 2019 Transition Adjustment Mechanism, the Commission approved a settlement in which parties agreed that PacifiCorp would file a RAC revision on January 2, 2019 (instead of April 1 as set forth in Schedule 202).⁴ The parties to this settlement also agreed to support an expedited schedule to allow for rates effective by July 1, 2019. To reflect the current construction timelines and to accommodate the staggered in-service dates associated with the company's repowering facilities, PacifiCorp is now proposing two rate changes: the first rate change effective October 1, 2019 and the second rate change effective December 1, 2019. This timeline still allows PacifiCorp to seek contemporaneous recovery of the repowering projects without the need to file for a deferral of capital costs associated with the repowering projects. These staggered rate effective dates also allow for minimizing potential regulatory lag and maximizing of the matching of costs and benefits.⁵

The October 1, 2019 rate effective date will include the repowering projects for Leaning Juniper, Seven Mile Hill I, Seven Mile Hill II, and Glenrock I. The December 1, 2019 effective date will include the repowering projects for Goodnoe Hills, High Plains, McFadden Ridge, Marengo I and Marengo II.

This tariff filing is supported by testimony and exhibits from the following company witnesses:

- Etta P. Lockey, Vice President, Regulation
- Timothy J. Hemstreet, Director, Renewable Energy Development
- Rick T. Link, Vice President, Resource Planning
- Steven R. McDougal, Director, Revenue Requirements
- Judith M. Ridenour, Specialist, Pricing and Cost of Service

Confidential information has been provided under Order No. 18-490.

This supporting testimony sets forth the benefits of repowering (including qualification for production tax credits), provides support for a finding that the investments were prudent and in the public interest, sets forth the details of the company's RAC and the company's proposal for ratemaking treatment of the repowering projects (including a description of the relevant portions

³ The 900.1 MW capacity reflects all of PacifiCorp's wind repowering project, except Rolling Hills, which is not in Oregon rates. Inclusive of Rolling Hills, PacifiCorp is repowering 999.1 MW of company-owned wind capacity.

⁴ A special condition is proposed for Schedule 202 which will accommodate a timeline different than the language currently in the tariff.

⁵ The anticipated in-service date for these projects was July 1, 2019 at the time the stipulation agreement was entered in Docket No. UE 339.

of the settlement approved in docket UE 339), provides the construction timeline for the repowering projects, addresses how repowering was included in the company's Integrated Resource Plan, and provides the revenue requirement associated with the repowering projects.

In addition, PacifiCorp proposes a housekeeping edit to remove the second-to-last sentence in the Purpose section of Schedule 202 to remove outdated language associated with Senate Bill 408. The sentence references OAR 860-022-0041, which was repealed following the enactment of Senate Bill 967 in 2011 in the rulemaking docketed as AR 553. This housekeeping edit is appropriate because this language no longer applies.

B. Proposed Procedural Schedule

In the Stipulation approved in Order No. 18-421, the Commission approved the stipulating parties' agreement that the RAC would follow a schedule designed to allow for rates effective July 1, 2019. As noted above, the company is now requesting the first rate change for effect on October 1, 2019.⁶ Based on this later effective date, PacifiCorp proposes the procedural schedule described as follows, subject to the availability of the Commission and interested parties:

RAC Filed	January 2, 2019
Prehearing Conference	January 23, 2019
Staff and Intervenor Testimony	March 6, 2019
Settlement Conference	April 3, 2019
Rebuttal Testimony	May 8, 2019
Hearing	June 25, 2019
Target Commission Decision	September 1, 2019
RAC Update Filing (if needed)	September 15, 2019
Effective Date for New Rates	October 1, 2019
Revised Tariff Sheet Filing	November 1, 2019
Effective Date for New Rates	December 1, 2019

To allow for the parties to conduct their review of the filing within this schedule, PacifiCorp requests the scheduling of a prehearing conference in this docket as soon as practicable and suggests January 23.

C. Tariff Sheets

Third Revision of Sheet No. 202-1	Schedule 202	Renewable Adjustment Clause
First Revision of Sheet No. 202-2	Schedule 202	Renewable Adjustment Clause

⁶ The stipulating parties agreed that if the expected in-service date for the first RAC-eligible project goes beyond July 1, 2019, the stipulating parties would not oppose a later rate effective date. *See* Order 18-421, Appendix A at 4, fn. 5.

To support this filing and meet the requirements of OAR 860-022-0025 and OAR 860-022-0030, PacifiCorp submits proposed Schedule 202 as Exhibit PAC/502 and has included in the exhibits accompanying the direct testimony of Ms. Ridenour the following:

Exhibit PAC/501: Renewable Adjustment Clause, Rate Spread and Rate Calculations Exhibit PAC/503: Estimated Effect of Proposed Price Changes Exhibit PAC/504—Monthly Billing Comparisons for October 1 Exhibit PAC/505—Monthly Billing Comparisons for December 1

As shown on Exhibit PAC/503, the filing results in an overall increase of \$16.0 million or 1.2 percent, on a net basis, effective October 1, 2019, followed by an incremental increase of \$20.8 million 1.6 percent, on a net basis, effective December 1, 2019. This proposed change will affect approximately 614,000 customers. A residential customer using 900 kWh per month would see a monthly bill increase of \$1.18 beginning October 1 plus an additional \$1.51 beginning December 1. The total monthly bill increase for this customer from present rates is \$2.69.

D. Correspondence

It is respectfully requested that all communications on this filing be addressed to:

RENEWABLE ADJUSTMENT CLAUSE	3
OVERVIEW OF REPOWERING	7
CUSTOMER BENEFITS	10
CONCLUSION	12

1	Q.	Please state your name, business address, and present position with PacifiCorp.
2	A.	My name is Etta P. Lockey. My business address is 825 NE Multnomah Street, Suite
3		2000, Portland, Oregon 97232. My title is Vice President, Regulation.
4		QUALIFICATIONS
5	Q.	Briefly describe your education and business experience.
6	A.	I have a Bachelor of Arts degree in Political Science from the University of Oregon
7		and a Juris Doctorate from the Northwestern School of Law of Lewis and Clark
8		College. I started at PacifiCorp as an attorney in 2013 and assumed my current role
9		as Vice President, Regulation in 2017.
10	Q.	Have you testified in previous regulatory proceedings?
11	A.	Yes. I have previously testified in regulatory proceedings in Oregon and California.
12		PURPOSE OF TESTIMONY
13	Q.	What is the purpose of your testimony in this proceeding?
14	A.	My testimony explains the benefits to customers from repowering the company's
15		existing wind resources and outlines why wind repowering is an opportunity for
16		customers that is both prudent and in the public interest. I also discuss PacifiCorp's
17		Renewable Adjustment Clause (RAC) mechanism and describe the company's
18		proposal for the ratemaking treatment of the repowering project, including a
19		discussion of the relevant portions of the settlement approved by the Public Utility
20		Commission of Oregon (Commission) in docket UE 339, PacifiCorp's 2019
21		Transition Adjustment Mechanism (TAM).

1

SUMMARY OF TESTIMONY

2 **Q.** Please summarize your testimony.

3	A.	Beginning in 2018, PacifiCorp began upgrading or "repowering" 900.1 megawatts
4		(MW) of company-owned, installed wind capacity (495 MW in Wyoming, 304.6 MW
5		in Washington, and 100.5 MW in Oregon) with longer blades and new technology to
6		generate more energy in a wider range of wind conditions. ¹ The upgrades will
7		increase output of the wind facilities by 26.7 percent on average, extend the operating
8		life of the facilities, and allow the facilities to requalify for federal production tax
9		credits (PTCs) for an additional 10 years. To receive the full PTC benefits for
10		customers, the repowered facilities must be commercially operational by the end of
11		2020. PacifiCorp seeks to include in rates the costs associated with repowered
12		facilities that are expected to come online by December 31, 2019.
13	Q.	Please identify the other PacifiCorp witnesses supporting this RAC?
14	А.	PacifiCorp's filing is supported by testimony from the following witnesses:
15		Mr. Timothy J. Hemstreet, Director of Renewable Energy Development,
16		provides a detailed scope of the company's wind repowering project, including
17		technical details, qualification for PTC benefits, increased energy production, reduced
18		operating costs, and continued system reliability. Mr. Hemstreet also addresses the
19		process and timing of wind-turbine generator (WTG) equipment purchases,
19 20		process and timing of wind-turbine generator (WTG) equipment purchases, construction requirements, construction timelines, and the disposition of removed

¹ The 900.1 MW capacity reflects all of PacifiCorp's wind repowering project, except Rolling Hills, which is not in Oregon rates. Inclusive of Rolling Hills, PacifiCorp is repowering 999.1 MW of company-owned wind capacity.

1		Mr. Rick T. Link, Vice President of Resource and Commercial Strategy,
2		testifies on the economic analysis that supports the prudence of PacifiCorp's wind
3		repowering project and quantifies customer benefit resulting from repowering.
4		Mr. Link also explains the wind repowering planning and analysis included in the
5		company's 2017 Integrated Resource Plan (2017 IRP).
6		Mr. Steven R. McDougal, Director of Revenue Requirements, provides the
7		revenue requirement associated with the wind repowering project and explains the
8		proposal for the ratemaking treatment of the costs and benefits of the wind
9		repowering project in rates, the accounting treatment of the replaced wind plant
10		equipment, and the inter-jurisdictional allocation of costs.
11		Ms. Judith M. Ridenour, Specialist, Pricing and Cost of Service, presents the
12		company's proposed RAC prices and proposed tariff changes and provides the impact
13		
		of the proposed rate changes on customers' bills.
14		of the proposed rate changes on customers' bills. RENEWABLE ADJUSTMENT CLAUSE
14 15	Q.	
	Q. A.	RENEWABLE ADJUSTMENT CLAUSE
15	-	RENEWABLE ADJUSTMENT CLAUSE Please describe PacifiCorp's RAC.
15 16	-	RENEWABLE ADJUSTMENT CLAUSE Please describe PacifiCorp's RAC. The RAC is the automatic adjustment clause created in accordance with Section 13 of
15 16 17	-	RENEWABLE ADJUSTMENT CLAUSE Please describe PacifiCorp's RAC. The RAC is the automatic adjustment clause created in accordance with Section 13 of Senate Bill 838 to allow for the timely recovery of costs associated with renewable

² See In the Matter of the Public Utility Commission of Oregon Investigation of Automatic Adjustment Clause Pursuant to SB 838, Docket No. UM 1330, Order No. 07-572 at 1 (Dec. 19, 2007).

Northwest Utilities), and the Oregon Citizens' Utility Board.³ PacifiCorp's RAC is
 set forth in Schedule 202.⁴

3 Q. Has PacifiCorp previously used the RAC to incorporate renewable resources 4 into rates?

- 5 A. Yes. The Commission authorized recovery through the RAC for PacifiCorp's
- 6 investments in the Leaning Juniper, Marengo, and Blundell resources in 2008,⁵ and
 7 Seven Mile Hill II and Glenrock III resources in 2009.⁶

8 Q. What is PacifiCorp's proposal for cost recovery through the RAC?

- 9 A. The company seeks to recover the revenue requirement associated with the
- 10 investments related to the repowering of its wind resources as described in this filing,
- 11 supported by the testimony and exhibits from the identified company witnesses.
- 12 PacifiCorp proposes to implement cost recovery in two separate rate changes to
- 13 accommodate the expected in-service completion dates of the repowering project.
- 14 PacifiCorp expects to implement a rate change on October 1, 2019, for the
- 15 completion of repowering at Leaning Juniper, Seven Mile Hill I, Seven Mile Hill II,
- 16 and Glenrock I, and a second rate change on December 1, 2019, for the completion of
- 17 Goodnoe Hills, High Plans, McFadden Ridge, Marengo I and Marengo II. This
- 18 approach minimizes the number of rate changes while also limiting regulatory lag on
- 19 recovery of the completed repowered projects.

³ Order No. 07-572 at 2.

⁴ Order No. 07-572, App. A at 20-21.

⁵ In the matter of PacifiCorp, dba Pacific Power, Application for an Accounting Order Approving Deferral of Costs Relating to Renewable Resources Pursuant to Senate Bill 838, Docket No. UM 1338, Order No. 08-508 (Oct. 22, 2008).

⁶ See *In the matter of PacifiCorp, dba Pacific Power, Application for Deferred Accounting*, Docket No. UM 1412, Order No. 09-072 (March 2, 2009) and Advice No. 09-015, Revising Schedule 203, Renewable Resource Deferral Adjustment, filed November 25, 2009, allowed (approved) on December 22, 2009.

1 2 Q.

last RAC filing was implemented in 2009?

Does the company propose any updates to the RAC based on changes since the

3 Yes. The company proposes to update the applicability of the RAC rate schedule to A. 4 include direct access customers. PTCs have been included in the calculation of the TAM revenue requirement since 2017.⁷ In the company's last TAM, UE 339, the 5 final revenue requirement included the benefits of PTC's for the resources included in 6 7 this RAC. Direct access customers receive the benefit of these PTCs through the 8 calculation of their transition adjustments. Transition adjustments are a market-based 9 credit for the energy freed up when a customer takes direct access offset by the cost 10 of the TAM rate. Incorporating PTC credits into the TAM rate lowered the TAM rates and thereby increased the transition credits.⁸ Since direct access customers are 11 12 receiving the benefit of PTCs for these resources through transition adjustments, it is 13 appropriate that the proposed RAC charges for these resources also apply to direct 14 access customers. 15 When costs for these RAC resources are rolled into base rates as part of a Q.

16 general rate case, will direct access customers pay those costs?

17 A. Yes. The cost of the RAC resources are generation costs that are recovered through

18 Schedule 200, Base Supply Service. Direct access customers pay the rates in

- 19 Schedule 200.
- 20 Q. Have proposed tariff changes been included in this filing?
- A. Yes. The proposed tariff changes are provided in Exhibit PAC/502 accompanying
 the direct testimony of Ms. Ridenour.

⁷ Docket No. UE 307, PacifiCorp's 2017 Transition Adjustment Mechanism.

⁸ Or, in the case where the transition adjustment is a charge, the inclusion of PTCs lowered the charge.

1 Q. Why is PacifiCorp filing the RAC now?

2 A. The RAC specifies that it will be filed on April 1, concurrent with the filing of a 3 TAM. However, in PacifiCorp's 2019 TAM, the Commission approved a settlement 4 in which parties agreed that PacifiCorp would file a RAC by January 2, 2019. Parties 5 also agreed to support an expedited schedule to allow for conclusion of the RAC 6 proceeding by July 1, 2019, before the first repowering facility is complete. This 7 timeline allows PacifiCorp the opportunity to seek contemporaneous recovery of the repowering project without the need to file for a deferral of capital costs associated 8 9 with the repowering projects.

10 Q. Does PacifiCorp's filing deviate from the RAC requirements in any other ways?

A. Yes. The RAC contemplates that both the costs and benefits of renewable projects be
considered as part of the RAC filing. However, as part of the settlement in the 2019

13 TAM, PacifiCorp agreed to reflect the net power cost benefits, including the PTCs, in

14 the 2019 TAM. The incremental generation provided by the repowered wind projects

15 is zero-fuel-cost energy and either displaces higher cost energy or provides energy for

- 16 off-system sales, thus reducing net power costs. In the 2019 TAM, net power costs
- were approximately \$400,000 lower due to repowering. Additionally, the 2019 TAM
 includes approximately \$4 million of customer benefits from PTCs.

19 Q. Please explain the timing differences that result from the costs and benefits being
 20 included in separate filings?

A. The repowering costs and benefits are aligned between the RAC and the 2019 TAM;

- 22 however, there is a timing difference as to the impact to customer rates. For example,
- 23 in the 2019 TAM customers will receive four months of repowering benefits for

1		Glenrock I since the benefits were included in the TAM beginning October 1, 2019
2		and this is the start date in the RAC to begin recovering the repowering costs. The
3		timing difference is a result of the different rate effective dates between the 2019
4		TAM and the RAC. The inclusion of repowering benefits in the 2019 TAM allowed
5		customers to begin receiving the benefits of the repowering project January 1, 2019.
6		In other words, the four months of repowering benefits for Glenrock I are given to
7		customers over the course of 2019. In the RAC, PacifiCorp will not begin to recover
8		the costs associated with the repowering project until the first proposed rate change of
9		October 1, 2019.
10		OVERVIEW OF REPOWERING
11	Q.	Please describe the repowering of PacifiCorp's wind facilities.
12	A.	Wind repowering takes advantage of technological advancements that enable
13		increased generation from existing wind resources. PacifiCorp's wind repowering
14		noiset involves installation of new actors with langer blades and new needles with
15		project involves installation of new rotors with longer blades and new nacelles with
10		higher-capacity generators. These plant upgrades increase energy output without
16		
		higher-capacity generators. These plant upgrades increase energy output without
16		higher-capacity generators. These plant upgrades increase energy output without changing the footprint, towers, and energy collector systems of the wind facilities.
16 17		higher-capacity generators. These plant upgrades increase energy output without changing the footprint, towers, and energy collector systems of the wind facilities. Longer blades allow wind turbines to produce more energy over a wider range of

16 17 18 19		higher-capacity generators. These plant upgrades increase energy output without changing the footprint, towers, and energy collector systems of the wind facilities. Longer blades allow wind turbines to produce more energy over a wider range of wind speeds. The nacelle is the housing that sits atop the tower and contains the gear box, low- and high-speed shafts, generator, controller, and brake. The new nacelles
16 17 18 19 20		higher-capacity generators. These plant upgrades increase energy output without changing the footprint, towers, and energy collector systems of the wind facilities. Longer blades allow wind turbines to produce more energy over a wider range of wind speeds. The nacelle is the housing that sits atop the tower and contains the gear box, low- and high-speed shafts, generator, controller, and brake. The new nacelles include sophisticated control systems and more robust components necessary to

overall average generation increase of 26.7 percent. Mr. Hemstreet's testimony
 provides greater detail on the technical aspects of the wind repowering project.

3

Q. Why is PacifiCorp repowering its wind fleet?

A. On December 18, 2015, Congress enacted changes to the federal Internal Revenue
Code that extended the full value of the PTC for wind energy facilities that began
construction in 2015 and 2016. The Internal Revenue Service issued guidance that
establishes a "safe harbor" for taxpayers to demonstrate the year a facility will be
deemed to "begin construction," thereby setting the value of the PTC.

9 PacifiCorp's repowering efforts allow for the requalification for PTCs for the 10 repowered wind facilities. To maximize the PTC benefit, in December 2016, 11 PacifiCorp executed and took delivery of safe-harbor purchases with General Electric 12 International, Inc., and Vestas-American Wind Technology, Inc. for new WTG 13 equipment. These safe harbor equipment purchases were of sufficient value to allow 14 the repowered facilities to qualify for 100 percent of available PTC benefits if they 15 are commercially operational within four calendar years—*i.e.*, by the end of 2020. 16 PacifiCorp's purchases in 2016 were important because wind facilities that began 17 construction after 2016 and come online after 2020 will receive a 20 percent decrease 18 in the tax benefits that can be passed on to customers, declining an additional 19 20 percent each year until the PTC is entirely phased out for projects that come online 20 after 2023. A delay in acquiring the safe harbor equipment would have made the 21 economics of repowering less attractive and deprived customers of substantial 22 benefits.

1		To meet the 2020 deadline, PacifiCorp ordered equipment and executed
2		contracts in 2018 and will complete much of the construction in 2019. The renewal
3		of the PTC has increased the demand for materials, equipment, and labor for wind
4		facilities. By completing a substantial amount of construction in 2019, PacifiCorp
5		will mitigate the risk of construction delays, or delays associated with the
6		procurement of equipment while still allowing sufficient time to meet the 2020
7		deadline.
8		In addition, completing the majority of the construction in 2019 will maximize
9		the value of the existing PTCs, while minimizing the period between the expiration of
10		the prior PTCs and the eligibility for the new PTCs. As further described in the
11		testimony and exhibits of Mr. Hemstreet, by achieving commercial operation in 2019
12		for most of the facilities, with the exception of Dunlap and Glenrock III (scheduled to
13		be completed in 2020), PacifiCorp will also minimize the time during which the wind
14		facilities are ineligible for PTCs.
15	Q.	Which wind resources will be repowered?
16	A.	PacifiCorp is repowering most of its Wyoming wind fleet (Glenrock I, Glenrock III,
17		Seven Mile Hill I, Seven Mile Hill II, High Plains, McFadden Ridge, and Dunlap);
18		the Marengo I, Marengo II, and Goodnoe Hills facilities in Washington; and the
19		Leaning Juniper facility in Oregon. This results in a total of 1,035 MW of installed
20		wind capacity, with 606 MW in Wyoming, 328 MW in Washington, and 101 MW in
21		Oregon.

1	Q.	Is PacifiCorp proposing to include all of these repowered wind resources in the
2		RAC at this time?
3	А.	No. PacifiCorp is seeking prudence review and rate recovery through the RAC for all
4		of the projects listed above with the exception of the Dunlap and Glenrock III
5		projects. The Glenrock III and Dunlap projects are not expected to come online until
6		July 2020 and November 2020, respectively, and PacifiCorp will seek separate
7		prudence review and rate recovery for these projects.
8	Q.	What is the total repowering cost PacifiCorp is seeking recovery for at this time?
9	А.	As described in Mr. McDougal's testimony the requested RAC recovery amounts are
10		\$16.0 million, through rates effective October 1, 2019, and an additional
11		\$20.8 million, through rates effective December 1, 2019.
12		CUSTOMER BENEFITS
13	Q.	What are the customer benefits resulting from wind repowering?
14	A.	The customer benefits resulting from wind repowering derive in part from the fact
15		that repowering allows PacifiCorp's existing wind resources to requalify for federal
16		PTCs-the benefits of which the company has already started passing back to Oregon
17		customers through decreased net power costs since January 1, 2019. As noted above,
18		the total revenue requirement related to the cost of repowering, excluding Glenrock
19		III and Dunlap, is \$36.8 million. As described in the testimony of Mr. Link, the
20		customer benefits, however, exceed the cost, meaning wind repowering will save
21		customers money.
22		Wind repowering creates these benefits by:
23 24		• Increasing zero-fuel-cost energy production from wind facilities between 21 to 39 percent because of longer blades and higher capacity generators;

1		• Reducing ongoing operating costs associated with aging wind turbines;
2		• Extending the useful lives of the wind facilities by at least 10 years;
3 4		• Reducing customer costs by requalifying the wind facilities for PTCs for an additional 10 years; and
5 6 7		• Improving the ability of the wind facilities to deliver cost-effective, renewable energy into the transmission system through enhanced voltage support and power quality.
8		The repowered facilities will deliver cost-effective energy to Oregon
9		customers, while saving customers money over the life of the investment.
10	Q.	Did PacifiCorp analyze wind repowering in the 2017 IRP?
11	A.	Yes. PacifiCorp's 2017 IRP, which was acknowledged by Commission Order
12		No. 18-138 issued on April 27, 2018, includes wind repowering as an integral
13		component of the preferred portfolio, meaning that it was selected as a least-cost,
14		least-risk resource option. ⁹
15	Q.	Does PacifiCorp's economic analysis demonstrate that the wind repowering
16		project will provide net benefits to customers?
17	A.	Yes. PacifiCorp's economic analysis of the wind repowering project demonstrates
18		that it will provide substantial customer benefits. As described in more detail in
19		Mr. Link's testimony, PacifiCorp analyzed nine different scenarios, each with varying
20		natural gas and carbon dioxide (CO2) price assumptions, and all nine scenarios show
21		customer benefits ranging from \$121 million when assuming low natural gas and zero
22		CO ₂ prices to \$466 million when assuming high natural gas and high CO ₂ prices.
23		With medium natural gas price and CO ₂ price assumptions, wind repower results in

⁹ *In the Matter of PacifiCorp dba Pacific Power, 2017 Integrated Resource Plan,* Docket No. LC 67, Order No. 18-138 (Apr. 27, 2018).

1

customer benefits of \$273 million.

2	Q.	Is the repowering project prudent and in the public interest?
3	A.	Yes. As described above and in more detail in the testimony of Mr. Link, repowering
4		provides substantial customer benefits and is in the public interest. Repowering
5		increases the energy generation of PacifiCorp's existing wind facilities, while saving
6		customers money, and repowering provides these substantial customer benefits across
7		all market price and Clean Power Plan ¹⁰ scenarios modeled in the 2017 IRP—
8		demonstrating that wind repowering is both least-cost and least-risk. The benefits of
9		repowering accrue through the extended life of the existing wind resources, thus
10		providing long-term, cost-effective, emission-free generation to serve Oregon
11		customers. Therefore, PacifiCorp is requesting that the Commission find that the
12		repowering of these facilities is prudent and in the public interest.
13		CONCLUSION
14	Q.	What is your recommendation to the Commission?
15	A.	I recommend that by September 1, 2019, the Commission issue an order finding that
16		PacifiCorp's decision to repower its wind fleet is prudent and in the public interest,
17		approving the company's proposals for ratemaking, and for the continued recovery of
18		the replaced equipment.
19	Q.	Does this conclude your direct testimony?
20	A.	Yes.

¹⁰ Subsequent to the filing of the 2017 IRP, the Energy Protection Agency withdrew its rulemaking on the Clean Power Plan, effectively suspending implementation of the Clean Power Plan.

1	Q.	Please state your name, business address, and present position with PacifiCorp.
2	A.	My name is Timothy J. Hemstreet. My business address is 825 NE Multnomah
3		Street, Suite 1800, Portland, Oregon 97232. My title is Director of Renewable
4		Energy Development.
5		QUALIFICATIONS
6	Q.	Briefly describe your education and business experience.
7	А.	I hold a Bachelor of Science degree in Civil Engineering from the University of Notre
8		Dame in Indiana and a Master of Science degree in Civil Engineering from the
9		University of Texas at Austin. I am also a Registered Professional Engineer in the
10		state of Oregon. Before joining the company in 2004, I held positions in engineering
11		consulting and environmental compliance. Since joining PacifiCorp, I have held
12		positions in environmental policy, engineering, project management, and
13		hydroelectric project licensing and program management. In 2016, I assumed the role
14		of Director of Renewable Energy Development, in which I oversee the development
15		of renewable energy resources.
16	Q.	Have you testified in previous regulatory proceedings?
17	A.	Yes.
18		PURPOSE OF TESTIMONY
19	Q.	What is the purpose of your testimony in this proceeding?
20	А.	In support of PacifiCorp's application for recovery of costs for its wind repowering
21		project, my testimony provides technical information regarding the company's planned
22		upgrades to "repower" most of its wind fleet. Specifically, my testimony addresses:
23		• The scope of the project;

1 2		• The financial benefits of repowering resulting from the qualification for federal production tax credits (PTCs);
3		• The increased energy benefits following repowering;
4		• The reduced ongoing operating costs following repowering;
5		• The extension of wind facility asset lives after repowering;
6		• Project contract status and construction schedule; and
7		• The disposition of removed equipment.
8		SUMMARY OF TESTIMONY
9	Q.	Please summarize your testimony.
10	A.	The wind repowering project presents the opportunity to leverage prior investments in
11		PacifiCorp's wind fleet and enhance the future value of these resources for customers.
12		By executing wind turbine equipment purchases in late 2016, PacifiCorp secured the
13		opportunity to repower and renew the wind fleet and qualify for the full value of the
14		PTCs for another 10-year period. Repowering now provides a unique opportunity to
15		return PacifiCorp's wind turbines to like-new condition while enhancing their
16		performance and avoiding expenditures that maintain but do not enhance the value of
17		the wind fleet.
18		By incorporating recent technical advances that allow for installation of longer
19		blades on the existing towers and foundations, repowering will result in significantly
20		more low-cost energy for customers-694 gigawatt-hours (GWh) annually, or an
21		average increase of 26.7 percent. Further, repowering with new equipment will
22		extend the asset lives of the wind facilities by at least 10 years—allowing the wind
23		facilities to continue serving customers well into the future.

1		Finally, these benefits from repowering can be delivered to customers while
2		reducing, rather than increasing, costs to customers, as further described in the
3		testimony of Mr. Rick T. Link.
4	Q.	What is the company's proposal in this proceeding?
5	A.	PacifiCorp proposes to recover the costs of the wind repowering project through the
6		Renewable Adjustment Clause (RAC). As described in my testimony, the Public
7		Utility Commission of Oregon (Commission) should approve this proposal because
8		the wind repowering project is prudent and provides significant benefits to customers.
9		OVERVIEW OF WIND REPOWERING AND PROJECT SCOPE
10	Q.	Please briefly describe what repowering a wind facility entails.
11	A.	Repowering broadly describes the upgrade of an existing, operating wind facility with
12		new wind-turbine-generator (WTG) equipment that can increase a facility's
13		generating capacity and the amount of electrical generation produced from the
14		facility. Specifically, PacifiCorp's repowering plan involves replacing the nacelle,
15		hub and rotor of the WTG. See Exhibit PAC/201 for a depiction of a wind turbine
16		and its various components.
17	Q.	Which facilities does PacifiCorp propose to repower?
18	A.	By the end of 2019, PacifiCorp is planning to upgrade: (i) all of its wind facilities in
19		Wyoming (except the company's Foote Creek I, Glenrock III and Dunlap facilities),
20		including the facilities known as Glenrock I, Rolling Hills ¹ , Seven Mile Hill I, Seven
21		Mile Hill II, High Plains, and McFadden Ridge; (ii) its Leaning Juniper facility in
22		Oregon; and (iii) its Marengo I, Marengo II, and Goodnoe Hills facilities in

¹ The Rolling Hills wind project is not in Oregon rates and the company is not requesting in this filing to bring it in to Oregon rates through the RAC.

1		Washington. PacifiCorp plans to repower its Dunlap and Glenrock III facilities in
2		Wyoming in 2020 and, as discussed below, is still evaluating whether it will proceed
3		to repower its Foote Creek I facility in Wyoming. See Exhibit PAC/202 for a map
4		depicting the locations of each of PacifiCorp's wind facilities.
5	Q.	How many megawatts (MW) of installed wind capacity is PacifiCorp proposing
6		to repower?
7	A.	PacifiCorp is planning to repower 11 of its 12 wind facilities that are in Oregon rates
8		in 2019 and 2020, representing 900.1 MW of installed wind capacity. ² Broken down
9		by state, this consists of eight facilities in Wyoming comprising 495 MW, one facility
10		in Oregon of 100.5 MW, and three facilities in Washington comprising 304.6 MW.
11		Detailed information about the wind facilities PacifiCorp plans to repower is included
12		in Exhibit PAC/203.
13	Q.	Please explain why repowering is feasible for these wind facilities.
14	A.	The wind facilities PacifiCorp proposes to repower began commercial operations
15		between 2006 and 2010. Because of their age, they can be economically repowered,
16		or upgraded, with new technology that will improve their efficiency and increase their
17		generation output, without incurring the cost to replace the existing towers,
18		foundations, and energy collection systems. The existing foundations and towers,
19		although more than 10 years old in some instances, are adequately designed to
20		accommodate larger, more modern WTG equipment and have a sufficient remaining
21		useful life to economically justify the associated investment.

² The 900.1 MW capacity reflects all of PacifiCorp's wind repowering project, except Rolling Hills, which is not in Oregon rates. Inclusive of Rolling Hills, PacifiCorp is repowering 999.1 MW of company-owned wind capacity.

1		In contrast, at facility sites developed more than about 15 years ago, the WTG
2		equipment typically has a low generating capacity (i.e., sub-1,000 kilowatt) and the
3		towers and foundations supporting the nacelle and rotor do not have the height or
4		design strength to accommodate the installation of modern, larger nacelles and rotors
5		capable of generating a much greater amount of electricity per WTG. With these
6		older facilities, repowering usually involves the removal of all of the old wind turbine
7		equipment, including towers, foundations, and energy collection system, and
8		replacement with new equipment and energy collector circuits appropriately sized for
9		the new equipment.
10		Because PacifiCorp plans to repower its facilities in a way that allows the
11		company to reuse the existing infrastructure of the towers, foundations, and energy
12		collection systems, the energy and PTC benefits can be realized with a lower capital
13		investment than would be required for the redevelopment of entire sites.
14	Q.	Did PacifiCorp's 2017 Integrated Resource Plan (IRP) evaluate repowering all
15		of the facilities described above?
16	A.	Yes, except for Goodnoe Hills. When the 2017 IRP was developed, PacifiCorp had
17		not assessed repowering Goodnoe Hills. Since that time, however, PacifiCorp has
18		evaluated the facility and determined that Goodnoe Hills can be economically
19		repowered similar to the facilities evaluated in the 2017 IRP. Mr. Link describes the
20		company's analysis of the wind repowering project in the 2017 IRP, and the
21		Commission's order on the 2017 IRP.

1	Q.	Are the costs to repower the Dunlap and Glenrock III facilities in Wyoming
2		included in this filing?
3	А.	No. The Dunlap and Glenrock III facilities will be repowered in 2020, which is
4		outside the 2019 period for this RAC filing. Consistent with the settlement agreement
5		approved by the Commission in the 2019 Transition Adjustment Mechanism
6		proceeding, docket UE 339, only the wind facilities repowered in 2019 are included
7		in this filing.
8	Q.	Why did PacifiCorp exclude Foote Creek I in Wyoming from the proposed wind
9		repowering project at this time?
10	А.	As noted in the 2017 IRP action plan item 1a, PacifiCorp is still evaluating the
11		potential of repowering Foote Creek I. Repowering this older facility would involve
12		more comprehensive site redevelopment, as described above, which is different in
13		scope than the repowering projects proposed here.
14 15	FI	NANCIAL BENEFITS OF REPOWERING INCLUDING REQUALIFICATION FOR PTCS
16	Q.	What benefits will customers realize from wind repowering?
17	А.	Repowering the proposed wind facilities will requalify them for PTCs, and these
18		benefits will be fully passed on to PacifiCorp's customers through the Transition
19		Adjustment Mechanism, beginning in 2019, as described in Ms. Etta P. Lockey's
20		testimony (Exhibit PAC/100). Additionally, repowering will increase the amount of
21		emissions-free energy produced from the repowered facilities by 21 to 39 percent,
22		depending on the facility, as shown in Confidential Exhibit PAC/204. ³ Further, by

³ This range reflects increases under existing transmission interconnection agreements. The range is 22 percent to 39 percent if transmission interconnection agreements are modified to reflect the additional capacity available from the repowered turbines.

replacing older WTG equipment, which is subject to more failure and maintenance
issues than newer equipment, repowering will reduce PacifiCorp's ongoing operating
costs. Finally, repowering the wind facilities with new WTG equipment will extend
the useful lives of the facilities by at least 10 years, creating substantial energy and
capacity benefits for customers in the future when these wind facilities would
otherwise have been retired from service.

7

Q. How are the repowered wind facilities able to requalify for PTCs?

8 A. On December 18, 2015, Congress enacted changes to the federal Internal Revenue 9 Code that extended the full value of the PTC for wind energy facilities that began 10 construction in 2015 and 2016. The legislation also provided for a phase-out of the 11 PTC over three years, reducing the PTC value by 20 percent for wind facilities 12 beginning construction in 2017, 40 percent for wind facilities beginning construction 13 in 2018, and 60 percent for wind facilities beginning construction in 2019. The 14 Internal Revenue Service (IRS) has issued guidance that establishes a "safe harbor" 15 for taxpayers to demonstrate the year a facility will be deemed to "begin 16 construction," thereby setting the value of the PTC. If at least five percent of the total 17 project costs are incurred in 2016, then the facility qualifies under the IRS safe harbor 18 for the full value of the PTC, provided the taxpayer can demonstrate "continuous 19 efforts" to complete construction. The IRS has issued additional guidance that 20 establishes a safe harbor for satisfying this continuous-efforts standard. Under the 21 continuous-efforts safe harbor, the wind facilities must be in service by the end of the 22 fourth calendar year following the calendar year in which construction began. Thus, 23 wind facilities that began construction in 2016 must be in service no later than

1 December 31, 2020, to satisfy the continuous-efforts safe-harbor provisions. If the 2 facilities are not placed in service by December 31, 2020, the projects must satisfy 3 IRS requirements that continuous-efforts were expended to repower the facilities, 4 which is a difficult standard to meet. 5 Does PacifiCorp's repowering project qualify for the full value of the PTC under Q. 6 these rules? 7 A. Yes. Consistent with IRS guidance, a facility owner can demonstrate that 8 construction of a facility has begun in the year in which at least five percent of the 9 applicable project costs are incurred. If wind turbine equipment is purchased and 10 delivered in 2016, and the equipment comprises at least five percent of the applicable 11 project costs, a PTC safe harbor is created for the wind facilities subsequently 12 constructed. To meet this requirement, PacifiCorp executed safe-harbor equipment 13 purchases with General Electric International, Inc. (GE) and Vestas American Wind 14 Technology, Inc. (Vestas) in December 2016, and took delivery of equipment with a 15 value sufficient to give the company the ability to repower its entire wind fleet and 16 qualify the repowered wind facilities for 100 percent of the PTC value. 17 **Q**. What is the full value of the PTC for wind facilities? 18 For 2018, wind facilities that are qualified for the PTC will receive an estimated A. 19 2.4 cents per kilowatt-hour, or \$24 per megawatt-hour. This PTC value is adjusted 20 annually based upon an inflation index, and the PTC is available for energy produced 21 during the 10-year period after the wind facility begins commercial operation.

Q. What other requirements must repowered projects satisfy to qualify for the PTC?

3	A.	On May 5, 2016, the IRS issued Notice 2016-31 ⁴ (Notice), which provides guidance
4		on various aspects of qualifying for the PTC and whether new tax credits can be
5		claimed when wind turbines are repowered or retrofitted. The Notice generally
6		provides that the repowering costs must equal at least four times the fair market value
7		of the equipment that the owner retains from the original facility for the repowered
8		turbines to qualify for new PTCs. Thus, 80 percent of the fair market value of the
9		repowered WTG must result from repowering project costs while the value of the
10		retained components cannot exceed 20 percent of the fair market value of the new
11		facility. This "80/20" test is applied on a turbine-by-turbine basis. Each wind
12		turbine—composed of a foundation, tower, and machine head (including nacelle, hub
13		and rotor)—is considered a separate facility.
14	Q.	Do all of the wind turbines PacifiCorp is proposing to repower meet this 80/20
15		test?
16	A.	Yes. The repowering project has been scoped to ensure that the 80/20 test, which is
17		applied at the time the turbine is repowered, will be met for each turbine repowered.
18		Not all turbines at all wind facilities, however, will be repowered because the retained
19		value of the towers and foundations at certain wind turbines does not allow them to
20		meet the 80/20 test before the end of 2020, when the repowered wind facilities must

21 be completed to obtain the full PTC value.

⁴ The IRS Notice 2016-31 is available at: <u>https://www.irs.gov/irb/2016-23_IRB/ar07.html</u>.

Q.	Which wind facilities will not have all wind turbines repowered?
A.	Repowering at Glenrock I and Glenrock III, which are located near Glenrock,
	Wyoming, will not include all wind turbines. At these locations, 14 of the 92 wind
	turbines will not be repowered because they were constructed atop mine tailings at
	the company's reclaimed Glenrock coal mine and required special pile foundations.
	These special foundations were more expensive to construct than the standard
	foundations found elsewhere on those facility sites and at other PacifiCorp wind
	facility locations. Because the original construction cost of these foundations was
	higher than for standard foundations, the retained value of these foundations is also
	higher than the other foundations. For these 14 wind turbine locations, the higher
	retained value of the foundations means that repowering, while technically feasible,
	would not qualify those turbines for PTCs, which is necessary for the repowering to
	be economic. PacifiCorp plans to repower all of the turbines at the other wind
	facilities discussed above.
Q.	How else has PacifiCorp scoped the repowering project to maximize the benefits
	of available PTCs?
A.	As shown in Exhibit PAC/203, several of the wind facilities PacifiCorp proposes to
	repower are still within 10 years of their original commercial online date, though
	most have just recently completed 10 years of operation. Thus, the PTCs from
	original construction have either recently expired or are still accruing to the benefit of
	PacifiCorp's customers for a small remaining period until these existing PTCs expire
	10 years after the facilities' commercial online date. Between May 2018 and October
	2020, the PTCs associated with approximately 2.0 terawatt-hours (TWh) of electricity
	А. Q.

generated at PacifiCorp's wind facilities in Oregon rates will expire. On an annual
 basis, in 2018 dollars, the expiration of these PTCs represents the loss of
 approximately \$64 million per year in customer PTC benefits, as shown in Exhibit
 PAC/203.

5 To maximize the benefits of the existing PTCs available from the wind 6 facilities, PacifiCorp will generally delay repowering until the original PTCs have 7 expired. The exceptions to this are the High Plains, McFadden Ridge, and Dunlap 8 facilities (although Dunlap is not included in this case). To take advantage of 9 available construction capacity and the low-wind season in 2019, High Plains and 10 McFadden Ridge repowering will begin in advance of when PTCs expire at those 11 facilities in September 2019. In addition, if the company waited until the Dunlap 12 PTCs expire in October 2020, there would be insufficient time to complete 13 construction at Dunlap by the end of 2020, as required to re-qualify for PTCs. This 14 results in a slight truncation of the existing, original 10-year PTC period for these 15 facilities. As with all of the wind facilities, however, once these projects are 16 repowered a new 10-year period will begin where its generation is eligible for the full 17 value of PTCs.

18 Q. Have recent changes to federal tax laws impacted the ability of the repowering 19 projects to qualify for PTCs?

A. No. The recent tax law changes enacted into law in December 2017 have not
impacted the ability of the repowering projects to qualify for the full value of PTCs.

1 INCREASED ENERGY BENEFITS FOLLOWING REPOWERING

2 Q. Once repowered, how do the energy benefits of the wind facilities increase?

3 Repowering will involve the replacement of the existing machine heads including the A. 4 nacelle, hub and rotor. The new nacelles have generators that have a greater 5 nameplate generating capacity than the equipment that is removed. For example, the 6 nameplate rating of each turbine at the Wyoming facilities will increase from 1.5 MW 7 to 1.85 MW, while at the Marengo facility, the generator nameplate rating will 8 increase from 1.8 MW to 2.0 MW. Details regarding the proposed wind turbine 9 upgrades, capital project costs, in-service dates, and resulting energy benefits are 10 shown in Confidential Exhibit PAC/204.

11 In addition to the larger generators in the repowered turbines, PacifiCorp will 12 also install larger blades. With the larger blades, the rotor-swept area of the wind 13 turbines will increase between 37 to 56 percent, depending on the type of turbine. A 14 larger rotor-swept area allows more of the wind energy flowing past the wind turbine 15 to be captured and converted by the wind turbine into electricity. Because the size of 16 the rotors will increase, the repowered turbines will also include more robust hubs, 17 main shafts, bearings and couplings, and gearboxes suitable to handle the greater 18 torque exerted by the larger rotors.

Q. Will the larger blades installed with repowering increase the potential for avian
impacts at the wind facilities?

A. Although the larger blades will increase the overall risk zone (rotor-swept area) of the
 repowered wind turbines, this does not necessarily correlate with an increased risk of
 avian impacts at existing turbine sites. PacifiCorp will continue to implement its

1		current informed-curtailment protocols after repowering to minimize avian impacts.
2		Informed-curtailment involves the shutdown of wind turbines when species of interest
3		are in the vicinity. PacifiCorp's informed-curtailment protocols avoid avian impacts
4		regardless of the swept area of the rotor. PacifiCorp performs monthly monitoring at
5		all of its wind facilities and reports all findings to state wildlife agencies and the U.S.
6		Fish and Wildlife Service. PacifiCorp will continue this monthly monitoring to
7		determine if the new turbine blades cause additional impacts to avian species and will
8		engage with the appropriate agency to discuss and, if prudent and practicable,
9		implement additional avoidance, minimization, or mitigation measures.
10	Q.	How did PacifiCorp determine the amount of additional generation that will be
11		produced from the repowered wind turbines?
12	A.	PacifiCorp worked with its consultant, Black & Veatch (B&V), to use the extensive
13		data history from PacifiCorp's facilities to derive precise estimates of the energy
14		production expected from repowering. This analysis used millions of data points
15		from the operational record of the wind facilities and incorporated additional modeled
16		wake losses anticipated from the new equipment. Wake losses are the reduction in
17		generation at turbines downwind of other turbines due to reduced wind speed and
18		increased turbulence in the airflow—or wake—behind a turbine.
19		Based on its analysis, PacifiCorp and B&V estimate that energy production
20		following repowering will increase as shown in Confidential Exhibit PAC/204, and as
21		further discussed below. These results reflect as accurately as possible the energy
22		production that would have occurred from the repowered turbines under the same
23		operational conditions and availability as the existing equipment. However, these

1		repowering energy estimates likely are conservative. They are based solely on the
2		different equipment performance specifications of the newer equipment and do not
3		account for expected improvements in operational availability of the wind facilities
4		following repowering. Availability of the wind turbines likely will improve after
5		repowering given the additional sensors and condition monitoring systems in the
6		repowered turbines that should allow for improved diagnostics and implementation of
7		preventative maintenance measures that can reduce turbine down-time. Additionally,
8		PacifiCorp will enter into service agreements with the turbine suppliers GE and
9		Vestas with performance guarantees and incentives that are likely to result in more
10		availability and generation than PacifiCorp has achieved in the past under similar
11		mind and distance. These contracts are discussed in more detail later in this testimony.
11		wind conditions. These contracts are discussed in more detail later in this testimony.
11	Q.	What are the major power production advantages of the new equipment?
	Q. A.

Additionally, some of the new turbines begin producing power at a lower wind speed than the existing equipment; thus, the turbines can produce energy during lower wind conditions in which the current equipment may sit idle. Because the new turbines will have an increased generator capacity, the turbines will also produce more energy when wind speeds are

Q. Why did PacifiCorp not install this larger equipment when the wind facilities were initially constructed?

3 Wind turbine technology has continued to advance since the facilities were first A. 4 constructed between 2006 and 2010. The use of new composite materials has 5 allowed blade lengths to increase without adding weight, allowing for the extraction 6 of more energy from the available wind resources at the facility sites. In addition, 7 more sophisticated sensor and control systems in the wind turbines, combined with 8 improved blade pitch control systems, increase the ability of the wind turbine control 9 systems to implement load mitigation strategies on the wind turbines to reduce the 10 loading on the power train, towers and foundations. For new wind facilities, these 11 technology improvements mean that longer blades and additional generating capacity 12 are possible without a commensurate increase in cost to strengthen the turbine 13 structural components (including the tower and foundation). For new wind facilities, 14 this is one of the drivers towards reduced energy costs. For existing wind facilities, 15 these new load mitigation technologies mean that the existing towers and foundations 16 are suitable for the installation of larger equipment through repowering. 17 **Q**. How much additional energy will the repowered wind facilities produce? 18 As shown in Confidential Exhibit PAC/204, across the wind fleet, the proposed A. 19 repowered wind facilities are estimated to increase generation by 694 GWh per year

- 20 if the facilities are operated within the limits of their existing large generator
- 21 interconnection agreements—an increase of 26.7 percent.

Q. Is PacifiCorp planning to use the additional generating capacity provided by the repowered wind turbines?

3 Yes. To use the additional maximum generating capacity of the facilities provided by A. 4 the repowered wind turbines, PacifiCorp will need to modify its existing transmission 5 interconnection agreements for these facilities. Accordingly, PacifiCorp has filed 6 generation interconnection applications for the additional generation at the existing 7 points of interconnection for the planned repowering projects, except for Leaning 8 Juniper and Goodnoe Hills. Due to transmission constraints at Leaning Juniper and 9 Goodnoe Hills, PacifiCorp does not expect additional transmission capacity to be 10 available for those facilities.

11 PacifiCorp's transmission function is currently reviewing the submitted 12 applications and preparing the required studies under the company's Open Access 13 Transmission Tariff. Two separate studies are required, including (i) a system impact 14 study and (ii) a facilities study. The completed studies will provide information on 15 the transmission upgrades, if any, needed to accommodate the interconnection 16 request. Once all studies are complete, PacifiCorp's transmission function will 17 determine if it can offer revised Large Generator Interconnection Agreements to the 18 company's merchant function.

19 Transmission studies for the Marengo I and Marengo II facilities have been 20 completed and the company has executed a new interconnection agreement with 21 PacifiCorp's transmission function that allows the additional capacity to be 22 interconnected so that these facilities can deliver the increased capacity and the 23 associated energy to customers. The remaining transmission studies are still pending.

1	Q.	Is the repowering project economic even without the ability of the wind facilities
2		to generate at their full repowered nameplate capacity?
3	A.	Yes. Mr. Link demonstrates in his testimony (Exhibit PAC/300) that the repowering
4		project is economic even if the facilities are operated within their existing
5		transmission capacity limits. An adjustment to the large-generator interconnection
6		agreements to allow the facilities to be operated at full nameplate capability following
7		repowering simply improves the already favorable economics of the repowering
8		project. Because of the uncertainty regarding the ability of the Wyoming wind
9		facilities to interconnect the additional capacity, PacifiCorp's economic analysis is
10		based upon a scenario in which the Wyoming projects are operated within the
11		existing capacity of their transmission interconnection agreements.
12	Rŀ	EDUCED ONGOING OPERATIONAL COSTS FOLLOWING REPOWERING

This will reduce capital costs associated with replacing or refurbishing the equipment currently in service. Additionally, the new turbine equipment associated with repowering, will obviate, to a large extent, capital costs associated with major turbine component replacements and refurbishments

REDACTED

1		Further, capital costs will be reduced before repowering as the investment horizon for
2		the existing wind turbines closes and various capital replacements no longer make
3		economic sense given the short remaining installed life of the turbines to be
4		repowered.
5		The repowering project will also result in more certainty related to ongoing
6		operations and maintenance costs of the existing wind facilities. PacifiCorp will
7		execute full service agreements on the new GE turbines under which GE will be
8		responsible for operating and maintaining the new turbines for a fixed cost while
9		attaining a guaranteed production-based availability on the turbines. Under these
10		agreements, failure to meet the guaranteed availability, if not the result of an
11		excusable event defined in the contract, will result in the payment of liquidated
12		damages to the company. Customers will benefit by having operations and
13		maintenance costs fixed for the term of the agreement. Thus, there is greater cost
14		certainty related to the run-rate capital expenditures and operations and maintenance
15		costs of the repowering projects in addition to the cost certainty related to
16		construction. PacifiCorp's negotiated full service agreement with GE is for a
17		. For facilities employing
18		Vestas turbines, PacifiCorp has executed service agreements
19		
20	Q.	Will PacifiCorp's reduced capital investments during the transition to
21		repowering cause a reduction in the generation from the facilities?
22	А.	Yes. Before repowering is complete, some of the existing turbines will experience
23		component failures that render them unable to be economically returned to service. It

1 will be more economic for customers to idle these turbines than repair them given the 2 short period before repowering. As a result, PacifiCorp estimates that generation 3 from the wind facilities targeted for repowering will be reduced before repowering. 4 These estimates of pre-repowering generation impacts are factored into the economic 5 analysis presented in Mr. Link's testimony.

6 Q. Will the new equipment address any other operational cost issues?

7 A. Yes. In addition to the reduced capital run rate of the new equipment in the early 8 years after installation, repowering will avoid costs from replacing certain major 9 turbine components that are experiencing high failure rates. One category of avoided 10 costs relates to failures of certain models of gearboxes found in the Wyoming wind 11 fleet and Leaning Juniper and Marengo projects. These gearboxes, which are original 12 equipment from the manufacturers, are experiencing high failure rates compared to 13 other models of gearboxes installed in WTGs at these facilities and elsewhere within 14 the wind fleet. Consequently, PacifiCorp has experienced increased capital costs in 15 recent years to address the gearbox failures, and these models are no longer being re-16 installed as long-term replacement equipment after failure, given their poor historical 17 performance.

18 **Q**.

Why are these gearbox failures significant?

19 These gearbox failures generally cannot be repaired "up-tower". This means that the A. 20 repair cannot be completed within the nacelle without removing the damaged 21 equipment by crane. These failures cost approximately \$400,000 per occurrence, 22 including equipment and labor costs to purchase and install a replacement gearbox 23 and the costs of mobilizing a large crane to the site to remove and replace the

1 equipment. These costs also do not account for the lost generation from the time the 2 turbine is down until the repair is completed.

3 Q. How many gearbox failures of this type are expected if there is no repowering?

- 4 A. There are 230 of these gearbox models remaining in the wind fleet, and PacifiCorp
- 5 anticipates that all of these remaining gearboxes will fail within the next 15 years.

6 Q. Will repowering completely address these gearboxes with shorter-than-

anticipated service lives?

8 A. No. Three of the 14 wind turbines that will not be repowered at Glenrock I and 9 Glenrock III have these gearbox models that will need to be replaced, which is 10 factored into the economic analysis. Following repowering, these gearboxes—as well 11 as potential failures of other gearbox models at the non-repowered units—can be 12 replaced with those removed from the existing turbines as part of the repowering 13 effort, reducing the repair costs of the remaining gearboxes. The cost savings of 14 doing so, however, have not been factored into PacifiCorp's economic analysis 15 because the company is still evaluating how best to realize value for customers from 16 the removed equipment.

17

7

Q. Are other significant capital costs avoided with repowering?

18 Aside from the gearbox issues, repowering will also avoid ongoing capital A. expenditures related to blade costs at Goodnoe Hills. Blade expenditures at this 19 20 facility to address a blade design deficiency account for approximately 60 percent of 21 the budgeted capital costs associated with blade failures and refurbishments across 22 PacifiCorp's wind fleet, even though Goodnoe Hills accounts for only seven percent 23 of the turbines. Repowering is expected to bring blade costs for that facility in line

1 with PacifiCorp's expenditures at its other facilities, resulting in reduced capital costs 2 to keep the wind fleet meeting its operational performance targets. 3 Given these ongoing gearbox and blade failure costs, repowering is 4 particularly attractive because repowering avoids significant forecast capital 5 expenditures to maintain turbine production while extending asset life, increasing 6 generation, and requalifying the wind turbine for PTCs for another 10-year period. 7 Q. Will the new repowering equipment have similar failure issues as the old 8 gearboxes? 9 A. No. The gearbox models in the fleet that are experiencing high failure rates will not 10 be included in the equipment installed for repowering. Further, the equipment that 11 will be installed has evolved from the product lines of the existing turbines, rather 12 than arising from entirely new product offerings. Thus, the turbine suppliers have 13 had time to learn from their past experience with these turbine models and have made 14 adjustments in their designs, specifications, and choice of subcomponent suppliers to 15 enhance turbine reliability. Because of the warranty service requirements in the 16 turbine-supply contracts and because the turbine suppliers are often under long-term 17 service agreements for the turbines they supply—such as will be the case with the GE 18 turbines-the turbine suppliers have an incentive to improve the reliability of their 19 turbines. Thus, PacifiCorp does not expect to have the problems and expense it has 20 had in the past with specific gearbox models and the associated reliability concerns. **EXTENSION OF WIND FACILITY ASSET LIFE AFTER REPOWERING** 21 22 What is the current asset life of the wind facilities that will be repowered? **Q**. 23 A. All of the existing wind facilities are currently being depreciated assuming a 30-year

1		asset life. The facilities PacifiCorp plans to repower are currently scheduled to be
2		retired between 2036 and 2040 (see Confidential Exhibit PAC/204).
3	Q.	Will repowering the wind facilities extend their useful operating lives beyond the
4		currently planned retirement dates?
5	A.	Yes, repowering the wind facilities will extend their life 30 years from the repowering
6		date, adding approximately 10 years to their planned retirement dates.
7	Q.	How will repowering extend the useful life by 30 years from the repowering
8		date?
9	A.	The repowering projects are being designed by the turbine equipment suppliers to
10		meet the same design requirements that apply to WTGs used in new wind facility
11		construction. The wind turbine equipment suppliers are contractually required, as
12		would be the case with a new wind facility, to have their wind turbine designs for the
13		repowering projects certified by an independent third party to ensure that they meet or
14		exceed applicable International Electrotechnical Commission design standards used
15		in the wind turbine industry. These design standards are intended to ensure that the
16		equipment is appropriate for the site conditions and will perform satisfactorily over
17		the standard design life.
18	Q.	What factors will be independently reviewed to assess and certify the design?
19	A.	The third-party design assessment evaluates the site-specific load assumptions based
20		upon the climatic conditions at each facility and will assess the control and protection
21		systems for the wind turbine and their ability to meet the site design conditions. It
22		will also assess the electric components, the rotor blades, hub, machine components
23		(<i>i.e.</i> , drivetrain, main bearing and gearbox), and the suitability of the existing tower

	upon which the new wind turbine equipment will be installed.
Q.	Does the design certification also evaluate the ability of the existing foundations
	to handle the loads associated with the repowered turbines?
A.	No. The design certification will assess the design loads and the design assumptions
	regarding the ability of the new turbines and the existing towers to handle those loads.
	But as with new wind facility development, the facility owner must provide a
	foundation suitable to handle the loads imparted by the tower on the foundation.
Q.	Has PacifiCorp reviewed the foundations to ensure they are capable of handling
	the new turbines?
A.	Yes. PacifiCorp retained B&V to evaluate the ability of the existing foundations to
	handle the loads of the repowered turbines. B&V's evaluation indicates that the
	existing foundations are suitable for the repowered turbines. At the Leaning Juniper
	and Goodnoe Hills facilities, the foundations will require a standard retrofit to
	increase their strength.
Q.	Has PacifiCorp evaluated the foundations to determine if they are suitable for a
	30-year service life following repowering?
A.	Yes. For the foundations in which fatigue loading is a controlling design variable,
	B&V has assessed the ability of the foundations to handle the estimated fatigue
	loading anticipated for a 30-year period following repowering and has determined
	that all the foundations will be able to accommodate the additional loading.
	PROJECT CONTRACT STATUS AND CONSTRUCTION SCHEDULE
Q.	What is the status of contracting related to the repowering projects?
A.	PacifiCorp has executed a master retrofit contract with GE for the Wyoming projects
	А. Q. Д. А.

1		and the Leaning Juniper project in Oregon, and has executed turbine supply contracts
2		with Vestas for the other three projects. The scope, language, and risk profile of the
3		agreements with each of the companies is different.
4		The master retrofit contract commits GE to perform turn-key supply, delivery,
5		installation, and commissioning of the repowering turbines at a fixed price.
6		PacifiCorp has also executed fixed-price turbine supply agreements with Vestas and
7		has executed and negotiated separate contracts with wind energy construction
8		companies for installation of the Vestas equipment.
9	Q.	Has PacifiCorp begun the repowering projects under the GE master retrofit
10		contract?
11	A.	Yes. Retrofit work orders have been issued for all of those projects and the majority
12		of construction work will be completed in 2019.
13	Q.	Are the projects with Vestas also moving forward at this time?
14	A.	Yes. The turbine supply contracts with Vestas for the repowering of the Marengo I,
15		Marengo II and Goodnoe Hills facilities have been executed and Vestas is currently
16		manufacturing the equipment that will be supplied for the projects.
17	Q.	Do the contracts with the turbine suppliers provide for the costs of the turbines
18		(and installation in the case of GE) to be adjusted up or down for factors such as
19		inflation, currency indexes, or steel price indexes?
20	A.	No. The contracts provide that the prices are fixed and have no adjustment
21		mechanisms for those common price indexes. Generally, the turbine suppliers can
22		only seek a change order for price relief as a result of changes in state and/or local
23		law that impacts their costs. As such, the vast majority of repowering costs are now

fixed under these negotiated contracts which substantially reduces risk of cost over run.

3	Q.	When will the repowering projects be constructed?
4	A.	The repowering projects will mostly be completed in 2019—a year in advance of the
5		deadline for completing construction and achieving commercial operations of other
6		repowered facilities. PacifiCorp's construction schedule has been developed to
7		optimize the PTC benefits of the facilities and ensure that the facilities can be
8		constructed during the low-wind season-between March and November. A detailed
9		project schedule for the repowering projects is attached as Confidential Exhibit
10		PAC/206.
11	Q.	How has PacifiCorp designed the repowering projects to work within PTC-
12		timing constraints?
13	A.	As discussed above, the 2019 construction schedule for most of the facilities
14		optimizes the existing PTC benefits of the facilities and also allows for their
15		construction, generally, more than a year in advance of the December 31, 2020
16		deadline to achieve commercial operation.
17	Q.	What permitting requirements apply to repowering projects and has the
18		company obtained all the necessary permits to ensure the construction schedule
19		will not be delayed due to permitting issues?
20	A.	Because repowering does not increase the footprints of the existing wind facilities,
21		and since the facilities are operating under current local, state and federal permits and
22		authorizations, the permitting requirements for repowering are minimal. Because the
23		facility footprints are not altered and since repowering is unlikely to disturb additional

1		acreage not already covered by existing permits, additional standard construction
2		permits are limited. PacifiCorp has obtained all of the necessary major permits
3		required for the repowering projects to be completed, such as Federal Aviation
4		Administration permits, county conditional use permits, and Wyoming Industrial
5		Siting Division approvals. Necessary building permits, where not already in hand,
6		will be obtained a few months before construction efforts begin. Throughout the
7		repowering process PacifiCorp will ensure that the requirements of the existing
8		permits and authorizations are met, and will provide needed information to permitting
9		authorities to amend or modify the existing permits for the facilities to reflect the
10		change in turbine equipment, if needed.
11		DISPOSITION OF REMOVED EQUIPMENT
12	Q.	What is PacifiCorp planning to do with the existing equipment that will be
12 13	Q.	What is PacifiCorp planning to do with the existing equipment that will be removed?
	Q. A.	
13	-	removed?
13 14	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing
13 14 15	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing equipment that will be removed and is still evaluating those proposals against options
13 14 15 16	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing equipment that will be removed and is still evaluating those proposals against options for equipment disposal that have been offered by the repowering construction
13 14 15 16 17	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing equipment that will be removed and is still evaluating those proposals against options for equipment disposal that have been offered by the repowering construction contractors. Because PacifiCorp will be replacing the entire machine head (nacelle,
13 14 15 16 17 18	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing equipment that will be removed and is still evaluating those proposals against options for equipment disposal that have been offered by the repowering construction contractors. Because PacifiCorp will be replacing the entire machine head (nacelle, hub, and rotor) of the repowered turbines, the removed equipment has the potential to
 13 14 15 16 17 18 19 	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing equipment that will be removed and is still evaluating those proposals against options for equipment disposal that have been offered by the repowering construction contractors. Because PacifiCorp will be replacing the entire machine head (nacelle, hub, and rotor) of the repowered turbines, the removed equipment has the potential to be reused and redeployed to another site location. This may make the equipment
 13 14 15 16 17 18 19 20 	-	removed? PacifiCorp has issued a request for proposals related to the disposition of the existing equipment that will be removed and is still evaluating those proposals against options for equipment disposal that have been offered by the repowering construction contractors. Because PacifiCorp will be replacing the entire machine head (nacelle, hub, and rotor) of the repowered turbines, the removed equipment has the potential to be reused and redeployed to another site location. This may make the equipment valuable for redeployment elsewhere in the country, or perhaps elsewhere in North

1		equipment as spare parts for similar type turbines that will remain in service. This
1		equipment as spare parts for similar type turbines that will remain in service. This
2		also makes it difficult, however, to use current market pricing for used turbines as a
3		proxy for the potential salvage value of the equipment given the large number of
4		repowered turbines and associated spare parts that will become available in the next
5		several years. Because not all of PacifiCorp's GE turbines will be repowered, some
6		of the equipment can potentially be used as spare parts to service the non-repowered
7		turbines.
8	Q.	Given the uncertainty of the market for the removed equipment either for
9		redeployment or as spare parts, what was assumed in the economic analysis for
9 10		redeployment or as spare parts, what was assumed in the economic analysis for the salvage value of the equipment?
	A.	
10	A.	the salvage value of the equipment?
10 11	A.	the salvage value of the equipment? PacifiCorp has not assumed any salvage value for the removed equipment in its

1	Q.	Please state your name, business address, and present position with PacifiCorp.
2	A.	My name is Rick T. Link. My business address is 825 NE Multnomah Street, Suite
3		600, Portland, Oregon 97232. My position is Vice President, Resource Planning and
4		Acquisitions.
5		QUALIFICATIONS
6	Q.	Please describe your current responsibilities.
7	А.	I am responsible for PacifiCorp's integrated resource plan (IRP), implementing
8		resource request-for-proposals (RFP), structured commercial business and valuation
9		activities, long-term commodity price forecasts, and long-term load forecasts. Most
10		relevant to this proceeding, I am responsible for the economic analysis used to screen
11		significant resource investments.
12	Q.	Please describe your professional experience and education.
13	А.	I joined PacifiCorp in December 2003 and assumed the responsibilities of my current
14		position in September 2016. From 2003 through 2016, I have held several analytical
15		and leadership positions responsible for developing long-term commodity price
16		forecasts, pricing structured commercial contract opportunities, and developing
17		financial models to evaluate resource investment opportunities, negotiating
18		commercial contract terms, and overseeing development of PacifiCorp's resource
19		plans. I was responsible for delivering PacifiCorp's 2013, 2015, and 2017 IRPs, have
20		been directly involved with implementing several resource RFPs, and performed
21		economic analysis supporting a range of resource investment opportunities. Before
22		joining PacifiCorp, I was an energy and environmental economics consultant with
23		ICF Consulting (now ICF International) from 1999 to 2003, where I performed

1		electric-sector financial modeling of environmental policies and resource investment
2		opportunities for utility clients. I received a Bachelor of Science degree in
3		Environmental Science from the Ohio State University in 1996 and a Masters of
4		Environmental Management from Duke University in 1999.
5	Q.	Have you testified in previous regulatory proceedings?
6	A.	Yes. I have testified in proceedings before the Public Utility Commission of Oregon
7		(Commission), and the public utility commissions in Washington, California, Idaho,
8		Utah, and Wyoming.
9		PURPOSE AND SUMMARY OF TESTIMONY
10	Q.	What is the purpose of your testimony?
11	A.	I present and explain the economic analysis that shows PacifiCorp's decision to
12		upgrade, or "repower", certain wind resources is prudent and provides significant
13		customer benefits. I also summarize PacifiCorp's assessment of wind repowering
14		opportunities in the 2017 IRP.
15	Q.	Please summarize your testimony.
16	A.	PacifiCorp's economic analysis supports repowering approximately 999.1 megawatts
17		(MW) of existing wind resource capacity for twelve wind facilities—Glenrock I,
18		Glenrock III, Rolling Hills, Seven Mile Hill I, Seven Mile Hill II, High Plains,
19		McFadden Ridge, and Dunlap in Wyoming; Marengo I, Marengo II and Goodnoe
20		Hills in Washington; and Leaning Juniper in Oregon-in 2019 and 2020. Nine of
21		these facilities are included in this filing. The three facilities excluded from this filing
22		are two planned for construction in 2020 (Glenrock III and Dunlap) and Rolling Hills,
23		which is not in Oregon rates.

1	The repowered wind facilities will qualify for an additional 10 years of federal
2	production tax credits (PTCs), produce more energy, reset the thirty-year depreciable
3	life of the assets, and reduce run-rate operating costs. PacifiCorp's economic analysis
4	
4	of the wind repowering project demonstrates that net benefits, which include federal
5	PTC benefits, net power cost (NPC) benefits, other system variable-cost benefits, and
6	system fixed-cost benefits, more than outweigh net project costs.
7	Based on an economic analysis completed in February 2018, my testimony
8	shows that:
9 10	• The wind repowering project will deliver net customer benefits in all price-policy scenarios studied.
11 12 13 14	• The wind repowering project will produce present-value net customer benefits, based on analysis covering the remaining life of the repowered wind facilities, ranging between \$121 million to \$466 million (total system).
15 16 17 18	 Present-value gross customer benefits calculated over the remaining life of the repowered wind facilities range between \$1.14 billion and \$1.48 billion, which compares to present-value project costs totaling \$1.01 billion.
19 20 21 22 23	• These net and gross customer benefits are conservative, as they do not account for potential incremental benefits from renewable energy certificates (RECs), understate the potential benefits from reduced carbon-dioxide emissions, and assign no incremental capacity value associated with extending the life of the repowered wind facilities by 10-13 years.
24 25 26 27 28	• When measured over a 20-year period, the present value of net customer benefits from wind repowering range between \$139 million and \$273 million, which accounts for the nominal value of federal PTCs, but does not account for the value of incremental energy output that will increase significantly beyond 2036.
29	PacifiCorp performed updated analysis in August 2018 to understand how
30	more recent changes in other modeling assumptions affect project-by-project results
31	relative to those included in the February 2018 analysis. Based on this updated

1		economic analysis, my testimony shows that projected net customer benefits remain
2		similar to those calculated previously. This targeted reassessment confirms that the
3		repowering project is prudent. As with the February 2018 results, the net customer
4		benefits projected in the August 2018 analyses are conservative, as they do not
5		account for potential incremental benefits from RECs, and assign no incremental
6		capacity value associated with extending the life of the repowered wind facilities by
7		10-13 years.
8		2017 INTEGRATED RESOURCE PLAN
9	Q.	Did PacifiCorp analyze wind repowering in its 2017 IRP?
10	A.	Yes. The preferred portfolio in the 2017 IRP, representing PacifiCorp's least-cost,
11		least-risk plan to reliably meet customer demand over a 20-year planning period,
12		includes repowering 905 MW of existing wind resource capacity located in
13		Wyoming, Washington, and Oregon. As discussed later in my testimony, PacifiCorp
14		has since expanded the wind repowering scope to include its Goodnoe Hills wind
15		facility. With the addition of Goodnoe Hills, PacifiCorp is proceeding with its plans
16		to repower approximately 999.1 MW of existing wind capacity.
17	Q.	What led PacifiCorp to evaluate the wind repowering opportunity in its 2017
18		IRP?
19	A.	As explained in Mr. Timothy J. Hemstreet's testimony (Exhibit PAC/200),
20		PacifiCorp purchased safe-harbor equipment from General Electric International,
21		Inc., and Vestas American Wind Technology, Inc. in December 2016. Consistent
22		with Internal Revenue Service (IRS) guidance, these equipment purchases, totaling

\$77.8 million, secured an option for PacifiCorp to repower its fleet of owned wind
 resources, thereby qualifying them for the full value of federal PTCs.

Wind repowering presents an opportunity to deliver several different types of benefits for customers. First, federal PTCs will apply to 10 additional years of generation from each repowered wind resource. The current value of federal PTCs, which is adjusted annually for inflation by the IRS, is \$24 per megawatt-hour (MWh). At a federal and state effective tax rate of 24.587 percent, the current PTC equates to a \$31.82/MWh reduction in revenue requirement that can be passed through to customers.

Second, existing wind resources will be upgraded with modern technology,
which improves efficiency and increases energy output. The additional energy output
from these zero-fuel-cost assets provides incremental NPC benefits for customers.

Third, repowering a wind resource, which replaces the mechanical equipment
of an existing wind facility, resets the usable life of the asset (currently 30 years),
thereby extending and increasing NPC benefits over the period in which the
repowered wind resource would have otherwise been retired from service.

Finally, the turbine-supply contracts for repowering will include a two-year warranty on the new equipment, which will avoid capital expenditures that would otherwise be needed to replace or refurbish existing equipment. Moreover, PacifiCorp anticipates that new, modern equipment will reduce failure rates for certain wind turbine components within the wind fleet. Further, before installing the new equipment, PacifiCorp can avoid capital replacement costs for component failures on the existing equipment. This cost savings will be partially offset by lost

Direct Testimony of Rick T. Link

1		energy output for specific wind turbines from the time that component failures occur
2		through the time the new equipment is installed.
3		After executing its safe-harbor equipment purchase in December 2016,
4		PacifiCorp developed a wind repowering sensitivity in the first quarter of 2017, for
5		consideration in its 2017 IRP, to evaluate potential net customer benefits.
6	Q.	What wind resources did PacifiCorp include in the wind repowering sensitivity
7		presented in its 2017 IRP?
8	А.	PacifiCorp assumed repowering 905 MW of existing wind resource capacity in the
9		2017 IRP. Of the 905 MW, approximately 594 MW of this capacity are located in
10		Wyoming (Glenrock, Rolling Hills, Seven Mile Hill, High Plains, McFadden Ridge,
11		and Dunlap), approximately 101 MW are located in Oregon (Leaning Juniper), and
12		approximately 210 MW are located in Washington (Marengo). PacifiCorp has since
13		expanded the scope of the wind repowering project to include Goodnoe Hills, which
14		is located in Washington.
15	Q.	What were the results of the wind repowering sensitivity presented in
16		PacifiCorp's 2017 IRP?
17	А.	The 2017 IRP wind repowering sensitivity showed significant customer benefits
18		across a range of assumptions related to forward market prices and possible federal
19		carbon-dioxide (CO ₂) policy.
20	Q.	Did the wind repowering sensitivity influence selection of the preferred portfolio
21		in the 2017 IRP?
22	А.	Yes. The wind repowering sensitivity showed significant net customer benefits by
23		lowering the projected system present-value revenue requirement (PVRR) relative to

1		other resource portfolio options. Consequently, wind repowering was included in the
2		2017 IRP preferred portfolio, which represents PacifiCorp's plan to deliver reliable
3		and reasonably priced service with manageable risk for customers through specific
4		actions.
5	Q.	Did PacifiCorp include a wind repowering action item in its 2017 IRP action
6		plan?
7	А.	Yes. The 2017 IRP action plan, which lists specific steps PacifiCorp will take over
8		the next two to four years to deliver resources in the preferred portfolio, includes the
9		following action item:
10 11 12		PacifiCorp will implement the wind repowering project, taking advantage of safe-harbor wind-turbine-generator equipment purchase agreements executed in December 2016.
13 14 15		• Continue to refine and update economic analysis of plant-specific wind repowering opportunities that maximize customer benefits before issuing the notice to proceed.
16 17 18 19		• By September 2017, complete technical and economic analysis of other potential repowering opportunities at PacifiCorp wind plants not studied in the 2017 IRP (i.e., Foote Creek I and Goodnoe Hills).
20		• Pursue regulatory review and approval as necessary.
21 22 23		• By May 2018, issue engineering, procurement and construction (EPC) notice to proceed to begin implementing wind repowering for specific projects consistent with updated financial analysis.
24 25		• By December 31, 2020, complete installation of wind repowering equipment on all identified projects. ¹
26	Q.	Please summarize PacifiCorp's progress with this action item.
27	A.	PacifiCorp refined and updated its economic analysis of plant-specific wind

¹ PacifiCorp 2017 Integrated Resource Plan, Volume I at 16 (Apr. 4, 2017).

1		repowering opportunities, and is now including Goodnoe Hills in the wind
2		repowering project. Since the 2017 IRP, the economic analysis has been updated to
3		reflect more current assumptions, including changes in the federal tax rate for
4		corporations. The rest of my testimony presents and explains this economic analysis.
5		Mr. Hemstreet explains that PacifiCorp continues to evaluate repowering of the Foote
6		Creek facility in Wyoming, but due to differences in project scope for this older-
7		vintage facility, Foote Creek is not included in the economic analysis of the wind
8		repowering project at this time. Mr. Hemstreet also discusses the status of the
9		construction agreements and addresses the construction schedule.
10	Q.	Did the Commission acknowledge the 2017 IRP?
11	A.	Yes. The Commission acknowledged the 2017 IRP in Order No. 18-138, issued on
12		April 27, 2018. ² The Commission conditioned its acknowledgement of Energy
12 13		April 27, 2018. ² The Commission conditioned its acknowledgement of Energy Vision 2020 projects, which includes the wind repowering project, by reserving the

Vision 2020 projects, which includes the wind repowering project, by reserving the right to conduct a full reasonableness review in the future and limit risks to customers, and requiring an updated economic analysis in the 2017 IRP Update. Did PacifiCorp update its wind repowering analysis in its 2017 IRP Update, filed

² In the Matter of PacifiCorp, dba Pacific Power, 2017 Integrated Resource Plan, Docket LC 67, Order No. 18-138, 7-9 (April 27, 2018).

1		MODELING SCOPE, METHODOLOGIES, AND ASSUMPTIONS
2	Q.	What wind resources did PacifiCorp include in its economic analyses of the wind
3		repowering project, and how do those resources relate to this filing?
4	A.	The economic analyses described in my testimony cover the entire repowering
5		project, which consists of twelve wind facilities, in order to estimate customer
6		benefits from repowering approximately 999.1 MW of existing wind resource
7		capacity located in Wyoming, Oregon, and Washington in 2019 and 2020. These
8		economic analyses informed PacifiCorp's decision to move forward with the project.
9		As noted above, nine of these facilities are included in this filing, and three are
10		excluded (Glenrock III, Dunlap, and Rolling Hills).
11	Mode	eling Methodology
12	Q.	Please summarize the methodology PacifiCorp used in its economic analysis of
13		the wind repowering project.
14	A.	PacifiCorp relied on the same modeling tools used to develop and analyze resource
15		portfolios in its 2017 IRP to refine and update its analysis of the wind repowering
16		project. These modeling tools calculate a system PVRR by identifying least-cost
17		resource portfolios and dispatching system resources over a 20-year forecast period
18		(2017-2036). Net customer benefits are calculated as the present-value revenue
19		requirement differential (PVRR(d)) between two simulations of PacifiCorp's system.
20		One simulation includes the wind repowering project and the other simulation
21		excludes the wind repowering project. Customers are expected to realize net benefits
22		when the system PVRR with wind repowering is lower than the system PVRR
23		without wind repowering. Conversely, customers would experience increased costs if

the system PVRR with wind repowering were higher than the system PVRR without
 wind repowering.

Q. What modeling tools did PacifiCorp use to perform its economic analysis of the wind repowering project?

A. PacifiCorp used the System Optimizer (SO) model and the Planning and Risk model
(PaR) to develop resource portfolios and to forecast dispatch of system resources in
simulations with and without wind repowering.

8 Q. Please describe the SO model and PaR.

9 A. The SO model is used to develop resource portfolios with sufficient capacity to 10 achieve a target planning-reserve margin. The SO model selects a portfolio of 11 resources from a broad range of resource alternatives by minimizing the system 12 PVRR. In selecting the least-cost resource portfolio for a given set of input 13 assumptions, the SO model performs time-of-day, least-cost dispatch for existing 14 resources and prospective new resource alternatives, while considering the cost-and-15 performance characteristics of existing contracts and prospective demand-side 16 management (DSM) resources—all within or connected to PacifiCorp's system. The 17 system PVRR from the SO model reflects the cost of existing contracts, wholesale-18 market purchases and sales, the cost of new and existing generating resources (fuel, 19 fixed and variable operations and maintenance (O&M), and emissions, as applicable), 20 the cost of new DSM resources, and levelized revenue requirement of capital 21 additions for existing coal resources and potential new generating resources. 22 PaR is used to develop a chronological unit commitment and dispatch forecast 23 of the resource portfolio generated by the SO model, accounting for operating

1		reserves, volatility and uncertainty in key system variables. PaR captures volatility
2		and uncertainty in its unit commitment and dispatch forecast by using Monte Carlo
3		sampling of stochastic variables, which include load, wholesale electricity and
4		natural-gas prices, hydro generation, and thermal unit outages. PaR uses the same
5		common input assumptions that are used in the SO model, with resource-portfolio
6		data provided by the SO model results. The PVRR from PaR reflects a distribution of
7		system variable costs, including variable costs associated with existing contracts,
8		wholesale-market purchases and sales, fuel costs, variable O&M costs, emissions
9		costs, as applicable, and costs associated with energy or reserve deficiencies. Fixed
10		costs that do not change with system dispatch, including the cost of DSM resources,
11		fixed O&M costs, and the levelized revenue requirement of capital additions for
12		existing coal resources and potential new generating resources, are based on the fixed
13		costs from the SO model, which are combined with the distribution of PaR variable
14		costs to establish a distribution of system PVRR for each simulation.
15	Q.	How has PacifiCorp historically used the SO model and PaR?
16	A.	PacifiCorp uses the SO model and PaR to produce and evaluate resource portfolios in
17		its IRP. PacifiCorp also uses these models to analyze resource-acquisition

18 opportunities, resource retirements, resource capital investments, and system

19 transmission projects. The models were used to support the successful acquisition of

- 20 the Chehalis combined-cycle plant, to support selection of the Lake Side 2 combined-
- 21 cycle resource through a RFP process, and the SO model has been used to evaluate
- 22 installation of emissions control systems. These models were also be used to evaluate

1		bids in PacifiCorp's recent 2017R RFP, issued to solicit bids for new wind resources,
2		and in PacifiCorp's recent 2017S RFP, issued to solicit bids for new solar resources.
3	Q.	Are the SO model and PaR the appropriate tools for analyzing the wind
4		repowering opportunity?
5	A.	Yes. The SO model and PaR are the appropriate modeling tools when evaluating
6		significant capital investments that influence PacifiCorp's resource mix and affect
7		least-cost dispatch of system resources. The SO model simultaneously and
8		endogenously evaluates capacity and energy trade-offs associated with resource
9		capital projects and is needed to understand how the type, timing, and location of
10		future resources might be affected by the wind repowering project. PaR provides
11		additional granularity on how wind repowering is projected to affect system
12		operations, recognizing that key system conditions are volatile and uncertain.
13		Together, the SO model and PaR are best suited to perform a net-benefit analysis for
14		the wind repowering opportunity that is consistent with long-standing least-cost,
15		least-risk planning principles applied in PacifiCorp's IRP.
16	Q.	How did PacifiCorp use PaR to assess stochastic system cost risk associated with
17		wind repowering?
18	A.	Just as it evaluates resource-portfolio alternatives in the IRP, PacifiCorp uses the
19		stochastic-mean PVRR and risk-adjusted PVRR, calculated from PaR study results, to
20		assess the stochastic system-cost risk of repowering. With Monte Carlo sampling of
21		stochastic variables, PaR produces a distribution of system variable costs. The
22		stochastic-mean PVRR is the average of net variable operating costs from the
23		distribution of system variable costs, combined with system fixed costs from the SO

1		model. PacifiCorp uses a risk-adjusted PVRR to evaluate stochastic system cost risk.
2		The risk-adjusted PVRR incorporates the expected value of low-probability, high-cost
3		outcomes. The risk-adjusted PVRR is calculated by adding five percent of system
4		variable costs, from the 95 th percentile of the distribution of system variable costs, to
5		the stochastic-mean PVRR.
6		When applied to the wind repowering analysis, the stochastic-mean PVRR
7		represents the expected level of system costs from cases with and without
8		repowering. The risk-adjusted PVRR is used to assess whether wind repowering
9		causes a disproportionate increase to system variable costs under low-probability,
10		high-cost system conditions.
11	Q.	Please describe how the effective combined federal and state income tax rate
12		assumption is applied in the SO model and the PaR in the economic analysis.
13	A.	The effective combined federal and state income tax rate affects PacifiCorp's post-tax
14		weighted average cost of capital, which is used as the discount rate in the SO model
15		and PaR. Accounting for recent changes in tax law, the discount rate used in the
16		economic analysis is 6.91 percent.
17		The income tax rate also affects the capital revenue requirement for all new
18		resource options available for selection in the SO model. Capital revenue
19		requirement is levelized in the SO and PaR models to avoid potential distortions in
20		the economic analysis of capital-intensive assets that have different lives and in-
21		service dates. This is achieved through annual capital recovery factors, which are
22		expressed as a percentage of the initial capital investment for any given resource
23		alternative in any given year. Capital recovery factors, which are based on the

1 revenue requirement for specific types of assets, are differentiated by each asset's 2 assumed life, book-depreciation rates, and tax-depreciation rates. Because capital 3 revenue requirement accounts for the impact of income taxes on rate-based assets, the 4 capital recovery factors applied to new resource costs in the SO model were reflected 5 for each system simulation. 6 Finally, the income tax rate affects the tax gross-up of all PTC-eligible 7 resources. The current value of federal PTCs is \$24/MWh, which equates to a 8 \$31.82/MWh reduction in revenue requirement assuming an effective combined 9 federal and state income tax rate of 24.587 percent. The impact of the income tax rate 10 assumptions were applied to all PTC-eligible resource alternatives available in the SO 11 model. 12 **Q**. Did PacifiCorp analyze how other assumptions affect its economic analysis of the 13 wind repowering project? 14 A. Yes. In addition to assessing stochastic system cost risk, PacifiCorp analyzed the 15 wind-repowering project under a range of assumptions regarding wholesale market 16 prices and CO₂ policy assumptions. These price-policy assumptions drive NPC-17 related benefits, and so it is important to understand how the net-benefit analysis is

- 18 affected under a range of potential outcomes. PacifiCorp developed low, medium,
- 19 and high scenarios for the market price of electricity and natural gas and zero,
- 20 medium, and high CO₂ price scenarios. Each pair of model simulations—with and
- 21 without repowering, in both the SO model and PaR—was analyzed under each
- 22 combination of these price-policy assumptions. I summarize the assumptions for
- 23 each price-policy scenario later in my testimony.

Q. How did PacifiCorp assess which wind facilities to include in the scope of the wind repowering project?

3 PacifiCorp completed a series of SO model and PaR studies to determine how the A. 4 system PVRR changes when a specific wind facility is added or removed from the 5 scope of the wind repowering project. This project-by-project analysis was 6 performed by running one SO model simulation that included the full scope of the 7 wind repowering project and then 12 separate SO model simulations where one of the 8 repowered wind facilities is assumed to be excluded from the scope of the wind 9 repowering project. The total system cost from the SO model simulation where all 10 facilities are repowered and from the SO model simulation where one facility is 11 removed from scope is used to calculate the marginal PVRR(d) for each wind facility. 12 Using the resource portfolio from the SO model simulations, this same approach was 13 used to calculate the PVRR(d) for each wind facility using projected system costs 14 from PaR.

Q. What key assumptions did PacifiCorp update since analyzing the wind repowering project in its 2017 IRP?

A. Beyond the price-policy assumptions used to analyze a range of NPC-related benefits,
the updated wind repowering analysis reflects updated assumptions for up-front
capital costs, run-rate operating costs, and energy output for both the existing and
repowered wind facilities. PacifiCorp's analysis assumes an up-front capital
investment totaling approximately \$1.101 billion with a 25.7 percent average increase
in annual energy output (738 gigawatt-hours (GWh) per year). The cost-andperformance assumptions for the wind facilities studied in this updated economic

analysis are summarized in Confidential Exhibit PAC/301. In addition, as described
 further below, several other assumptions were updated in the August 2018 analysis to
 align with updates included in the 2017 IRP Update, which was filed after the
 February 2018 analysis was completed.

Did PacifiCorp analyze potential energy imbalance market (EIM) benefits in its

5 6 Q.

wind repowering analysis?

7 A. Yes. In its final 2017 IRP resource-portfolio screening process, PacifiCorp described 8 how the EIM can provide potential benefits when incremental energy is added to 9 transmission-constrained areas of Wyoming. Unscheduled or unused transmission 10 from participating EIM entities enables more efficient power flows within the hour. 11 With increasing participation in the EIM, there will be increasing opportunities to 12 move incremental energy from Wyoming to offset higher-priced generation in the 13 PacifiCorp system or other EIM participants' systems. The more efficient use of 14 transmission that is expected with growing participation in the EIM was captured in 15 the wind repowering analysis by increasing the transfer capability between the east 16 and west sides of PacifiCorp's system by 300 MW (from the Jim Bridger plant to 17 south-central Oregon). The ability to more efficiently use intra-hour transmission 18 from a growing list of EIM participants is not driven by the wind repowering project; 19 however, this increased connectivity provides the opportunity to move low-cost 20 incremental energy out of transmission-constrained areas of Wyoming. 21 How did PacifiCorp account for the unrecovered investments in the original Q. 22 equipment that will be replaced with new equipment?

23 A. The economic analysis assumes that PacifiCorp will fully recover the unrecovered

1		investment in the original equipment and earn its authorized rate of return on the
2		unrecovered balance over the 30-year depreciable life of each repowered facility.
3	Q.	Did PacifiCorp assume any salvage value for the equipment that will be replaced
4		with repowering?
5	A.	No. But any salvage value for the existing equipment would decrease the
6		unrecovered investment and increase customer benefits.
7	Annu	al Revenue Requirement Methodology
8	Q.	In addition to the system modeling used to calculate present-value net benefits
9		over a 20-year planning period, has PacifiCorp forecasted the change in
10		nominal-annual revenue requirement due to the wind repowering project?
11	A.	Yes. The system PVRR from the SO model and PaR is calculated from an annual
12		stream of forecasted revenue requirement over a 20-year time frame, consistent with
13		the planning period in the IRP. The annual stream of forecasted revenue requirement
14		captures nominal revenue requirement for non-capital items (e.g., NPC, fixed O&M)
15		and levelized revenue requirement for capital expenditures. To estimate the annual
16		revenue-requirement impacts of repowering, project capital costs need to be
17		considered in nominal terms (<i>i.e.</i> , not levelized).
18	Q.	Why is the capital revenue requirement used in the calculation of the system
19		PVRR from the SO model and PaR levelized?
20	A.	Levelization of capital revenue requirement is necessary in these models to avoid
21		potential distortions in the economic analysis of capital-intensive assets that have
22		different lives and in-service dates. Without levelization, this potential distortion is
23		driven by how capital costs are included in rate base over time. Capital revenue

1

2

requirement is generally highest in the first year an asset is placed in service and declines over time as the asset depreciates.

3 Consider the potential implications of modeling nominal capital revenue 4 requirement for a future generating resource needed in 2036, the last year of the 2017 5 IRP planning period. If nominal capital revenue requirement were assumed, the 6 model would capture in its economic assessment of resource alternatives the highest, 7 first-year revenue requirement capital cost without having any foresight on the 8 potential benefits that resource would provide beyond 2036. If nominal capital costs 9 were applied, the model's economic assessment of resource alternatives for the 2036 10 resource need would inappropriately favor less capital-intensive projects or projects 11 having longer asset lives, even if those alternatives would increase system costs over 12 their remaining life. Levelized capital costs for assets that have different lives and in-13 service dates is an established way to address these types of distortions in the 14 comparative economic analysis of resource alternatives.

Q. How did PacifiCorp forecast the annual revenue-requirement impacts of the
 wind repowering project?

A. In the models that exclude repowered wind, the annual stream of costs for wind
facilities that are within the wind repowering scope, including levelized capital, are
removed from the annual stream of costs used to calculate the stochastic-mean system
PVRR. Similarly, in the simulation that includes repowered wind, the annual stream
of costs for repowered wind facilities, including levelized capital and PTCs, are
temporarily removed from the annual stream of costs used to calculate the stochasticmean PVRR. The differential in the remaining stream of annual costs, which

1		includes all system costs except for those associated with the wind facilities that are
2		within the wind repowering scope, represents the net system benefit caused by the
3		wind repowering project.
4		These data are disaggregated to isolate the estimated annual NPC benefits,
5		other non-NPC variable-cost benefits (i.e., variable O&M and emissions costs for
6		those scenarios that include a CO ₂ price assumption), and fixed-cost benefits. To
7		complete the annual revenue-requirement forecast, the change in fixed costs for those
8		wind facilities included in the wind repowering scope, including nominal capital
9		revenue requirement and PTCs, are added back in with the annual system net benefits
10		caused by wind repowering.
11	Q.	Over what time frame did PacifiCorp estimate the change in annual revenue
12		requirement due to the wind repowering project?
13	A.	The change in annual revenue requirement was estimated through 2050. This
14		captures the full 30-year life of the new equipment installed on repowered wind
15		facilities.
16	Q.	How did PacifiCorp calculate the net annual benefits caused by wind repowering
17		beyond the 20-year forecast period used in PaR?
18	A.	The PaR forecast period runs from 2017 through 2036. The change in net system
19		benefits caused by wind repowering over the 2028-through-2036 time frame,
20		expressed in dollars-per-MWh of incremental energy output from wind repowering,
21		were used to estimate the change in system net benefits from 2037 through 2050.
22		This calculation was performed in several steps.

1		First, the net system benefits caused by wind repowering were divided by the
2		change in incremental energy expected from the wind repowering project, as modeled
3		in PaR over the 2028-through-2036 time frame. Next, the net system benefits per
4		MWh of incremental energy from the repowered wind projects over the 2028-
5		through-2036 time frame were levelized. These levelized results were extended out
6		through 2050 at inflation. The levelized net system benefits per MWh of incremental
7		energy output from the repowered wind projects over the 2037-through-2050 time
8		frame were then multiplied by the change in incremental energy output from
9		repowered wind projects over the same period.
10	Q.	Why did PacifiCorp use PaR results from the 2028-through-2036 time frame to
11		extend system cost impacts out through 2050?
12	A.	Consistent with the 2017 IRP, PacifiCorp's wind repowering analysis assumes the
13		Dave Johnston coal plant, located in eastern Wyoming, retires at the end of 2027.
14		When this plant is assumed to retire, transmission congestion affecting energy output
15		from resources in eastern Wyoming, where many repowered wind resources are
16		located, is reduced. The incremental energy output from repowered wind resources
17		provides more system benefits when not constrained by transmission limitations.
18		Consequently, the net system benefits caused by wind repowering over the 2028-
19		through-2036 time frame, after Dave Johnston is assumed to retire, is representative
20		of net system benefits that could be expected beyond 2036.
21	Q.	Did PacifiCorp calculate a PVRR(d) for the wind repowering project using its
22		estimate of annual revenue-requirement impacts projected out through 2050?
23	A.	Yes.

1	0	
1	Q.	Does the PVRR(d) calculated from estimated annual revenue requirement
2		through 2050 capture wind repowering benefits not included in the PVRR(d)
3		calculated from the 20-year forecast coming out of the SO model and PaR?
4	A.	Yes. The PVRR(d) calculated off of estimated annual revenue requirement extended
5		out through 2050 captures the significant increase in projected wind energy output
6		beyond the 20-year forecast period.
7	Q.	Why is there a significant increase in projected wind energy output beyond the
8		20-year forecast period ending 2036?
9	A.	The change in wind energy output between cases with and without repowering
10		experiences a step change in the 2036-through-2040 time frame, when the wind
11		facilities, originally placed in-service during the 2006-through-2010 time frame,
12		would otherwise have hit the end of their depreciable life. Before the 2036-through-
13		2040 time frame, the change in wind energy output reflects the incremental energy
14		production that results from installing modern equipment on repowered wind assets.
15		Beyond the 2036-through-2040 time frame, the change in wind energy output
16		between a case with and without repowering reflects the full energy output from the
17		repowered wind facilities that would otherwise be retired.
18	Price	-Policy Scenarios
19	Q.	Please explain why price-policy scenarios are important when analyzing the
20		wind repowering project.
21	A.	Wholesale-power prices, often set by natural-gas prices, and the system cost impacts
22		of potential CO ₂ policies influence the forecast of net system benefits from wind
23		repowering. Wholesale-power prices and CO ₂ policy outcomes affect the value of

1		system energy, the dispatch of system resources, and PacifiCorp's resource mix.
2		Consequently, wholesale-power prices and CO2 policy assumptions affect NPC
3		benefits, non-NPC variable cost benefits, and system fixed-cost benefits of wind
4		repowering. Because wholesale-power prices and CO ₂ policy outcomes are both
5		uncertain and important drivers to the wind repowering analysis, PacifiCorp studied
6		the economics of the wind repowering project under a range of different price-policy
7		scenarios.
8	Q.	What price-policy scenarios did PacifiCorp use in its wind repowering analysis?

- 10 studies was prepared in February 2018 and a more targeted set of studies was
- 11 prepared in August 2018 as validation.³ The February 2018 analysis represents the

I present two vintages of the wind repowering economic analysis—a complete set of

- 12 final set of studies used to support PacifiCorp's pre-approval proceedings in Idaho,
- 13 Utah, and Wyoming. The August 2018 analysis was prepared to understand how
- 14 updates to certain modeling assumptions, which I describe later in my testimony,
- 15 affect the economic analysis that was prepared in February 2018. The specific price-
- 16 policy scenarios used in each of these studies are described further below.
 - February 2018 Price-Policy Assumptions
- Q. What price-policy assumptions did PacifiCorp use in its February 2018 wind
 repowering analysis?
- 20 A. PacifiCorp developed three wholesale-power price scenarios (low, medium, and
- 21 high), and similarly developed three CO₂ policy scenarios (zero, medium, and high).

9

17

A.

³ For preapproval proceedings in other states, PacifiCorp performed an earlier project-wide study in early 2017. That study predated tax code reforms and was therefore supplanted by the February 2018 analysis, so I do not describe it further in this testimony.

1 2 The nine price-policy scenarios developed for the wind repowering analysis reflect different combinations of these scenario assumptions.

3		Considering that there is a high level of correlation between wholesale-power
4		prices and natural-gas prices, the wholesale-power price scenarios were based on a
5		range of natural-gas price assumptions. This ensures consistency between power
6		price and natural-gas price assumptions for each scenario. PacifiCorp implemented
7		its CO2 policy assumptions through a CO2 price, expressed in dollars-per-ton
8		recognizing that it is possible that future CO ₂ policies targeting electric-sector
9		emissions could be adopted and impose incremental costs to drive emission
10		reductions. CO ₂ price assumptions used in the price-policy scenarios are not intended
11		to mimic a specific type of policy mechanism (i.e., a tax or an allowance price under
12		a cap-and-trade program), but are intended to recognize that there might be future
13		CO ₂ policies that impose a cost to reduce emissions.
14	Q.	Please describe the natural-gas price assumptions used in the February 2018
15		price-policy scenarios.
16	A.	The medium-natural-gas price assumptions that are paired with zero CO ₂ prices
17		reflect natural-gas prices from PacifiCorp's official forward price curve (OFPC) dated
18		
		December 29, 2017. This OFPC uses observed forward market prices as of
19		December 29, 2017. This OFPC uses observed forward market prices as of December 29, 2017, for 72 months, followed by a 12-month transition to natural-gas
19 20		
		December 29, 2017, for 72 months, followed by a 12-month transition to natural-gas
20		December 29, 2017, for 72 months, followed by a 12-month transition to natural-gas prices based on a forecast developed by Example 1 . The medium-, low-, and high-

PAC/302 shows the range in natural-gas price assumptions from these third-party
 forecasts relative to those adopted for the price-policy scenarios to evaluate the wind
 repowering project.

4 The low-natural-gas price assumption was derived from a low-price scenario 5 . The medium-natural-gas price assumption, which is used developed by 6 beyond month 84 in the December 2017 OFPC, and in all months when medium-7 natural-gas prices are paired with medium or low CO₂ price assumptions, is based on 8 a base-case forecast from that is reasonably aligned with other base-case 9 forecasts. The high-natural-gas price assumption was based on a high-price scenario 10 that is characterized by exaggerated boom-bust cycles (cyclical from 11 periods of high prices and low prices). PacifiCorp smoothed the boom-bust cycle in 12 this third party's high-price scenario because the specific timing of these cycles are 13 extremely difficult to project with reasonable accuracy. 14 Figure 1 shows Henry Hub natural-gas price assumptions from the December

15 2017 OFPC, low-, and high-natural-gas price scenarios.

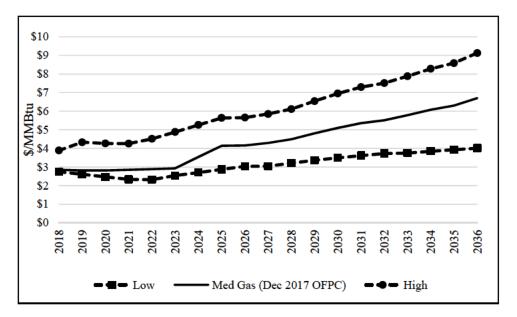

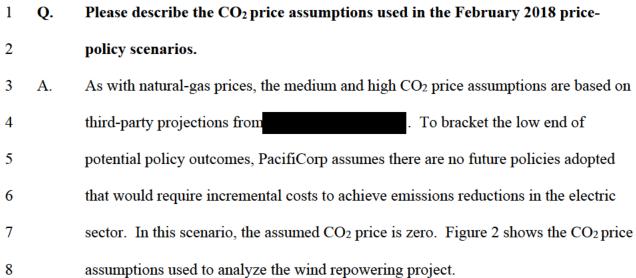

Figure 1. Nominal Natural-Gas Price Scenarios in the February 2018 Analysis

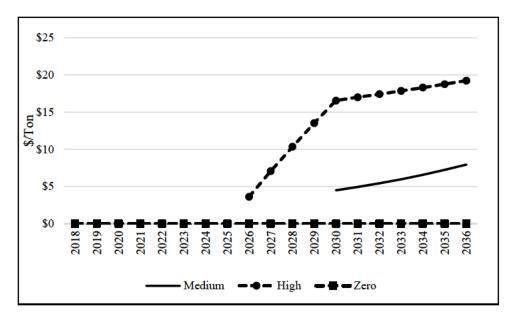

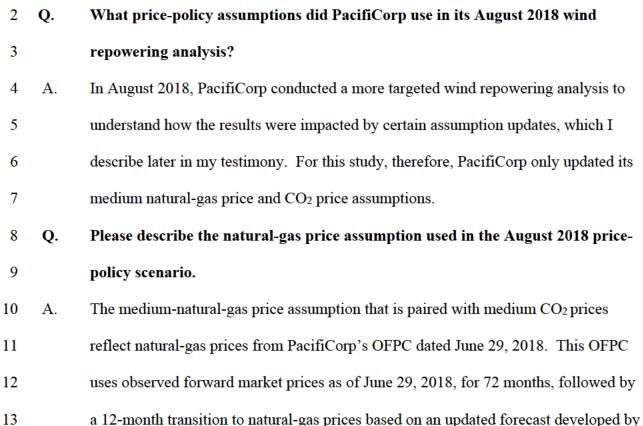

Figure 2. Nominal CO₂ Price Assumptions in the February 2018 Analysis

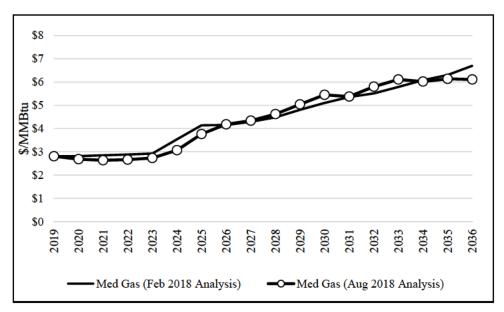

14

August 2018 Price-Policy Assumptions

1	Figure 3 shows Henry Hub natural-gas price assumptions used in the August
2	2018 wind repowering analysis alongside the medium natural gas price assumptions
3	used in February 2018 wind repowering analysis. The nominal levelized price over
4	the period 2019 through 2036 from the August 2018 analysis is \$3.97/MMBu, which
5	is down just two percent relative to the \$4.05/MMBtu levelized price from the
6	February 2018 analysis.

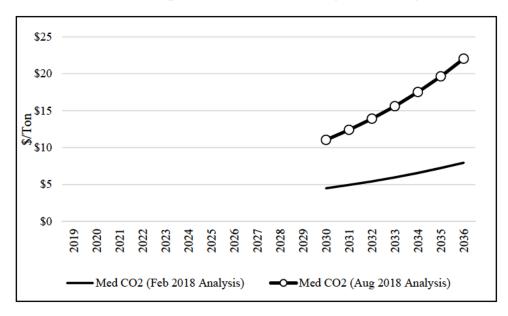

7 Q. Please describe the CO₂ price assumption used in the August 2018 price-policy 8 scenario.

14 this is driven by the fact that CO₂ price assumptions used in February 2018 analysis

1	were inadvertently modeled in 2012 real dollars instead of nominal dollars. As noted
2	below, this was corrected in the August 2018 analysis, which was modeled in
3	nominal dollars. The CO ₂ price assumptions used in the August 2018 analysis applies
4	inflation to determine the prices in nominal dollars.

Figure 4. CO₂ Price Assumptions in the August 2018 Analysis Relative to Medium Price Assumptions from the February 2018 Analysis

5 Other Assumption Updates in the August 2018 Analysis

6 Q. Beyond the price-policy assumptions discussed earlier in your testimony, what 7 other assumptions did you update in the August 2018 wind repowering analysis? 8 A. The August 2018 analysis includes updated hourly market price profiles, updated firm 9 resources, which includes 1,150 MW of new Wyoming wind resource capacity 10 consistent with the final shortlist from the 2017R RFP and inclusion of the Aeolus-to-11 Bridger/Anticline transmission line, updated proxy resource costs for new wind and 12 solar resources, and updated inflation rate assumptions. The August 2018 analysis 13 also reflects an updated load forecast, which was refreshed after PacifiCorp filed its 14 2017 IRP Update.

Table 1. Updated Assumptions in the August 2018 Analysis Relative to Assumptionsfrom the February 2018 Analysis

Description	Description February 2018 Analysis (Pre-Approval Proceedings)	
Load Forecast	August 2017	June 2018
Hourly Price Profile	PowerDex Scalar Method	CAISO Day-Ahead Method
Energy Vision 2020	No New Wind and Transmission	1,150 MW of Wyoming wind and the Aeolus-to- Bridger/Anticline Transmission Line
Other Resources	2017 IRP	2017 IRP Update plus Executed and Planned Solar PPAs
Annual Inflation Rate	2.22%	2.27%
Proxy Resource Costs	2017 IRP	2017 IRP Update

1

FEBRUARY 2018 WIND REPOWERING ANALYSIS

2 **Project-by-Project Results**

3 Q. What price-policy scenarios were used in the project-by-project analysis?

4 A. PacifiCorp used two price-policy scenarios—the low natural-gas and zero CO₂ price-

5 policy scenario and the medium natural-gas and medium CO₂ price-policy scenario.

- 6 Based on the results of these two price-policy scenarios, the company determined
- 7 which individual projects are expected to provide net customer benefits, and then
- 8 these projects were analyzed under all price-policy scenarios.

1	Q.	Please summarize the project-by-project PVRR(d) results calculated from the
2		SO model and PaR through 2036 when assuming medium natural-gas and
3		medium CO ₂ price-policy assumptions.
4	А.	Table 2 summarizes the PVRR(d) results for each wind facility. The PVRR(d)
5		between cases with and without wind repowering are shown for each wind facility
6		based on system modeling results from the SO model and PaR, before accounting for
7		the substantial increase in incremental energy beyond the 2036 time frame. When
8		applying medium natural-gas and medium CO2 price-policy assumptions, benefits
9		from repowering the Leaning Juniper wind facility are equal to costs. All other wind
10		facilities are projected to deliver net benefits.

Table 2. Project-by-Project SO Model and PaR PVRR(d)(Benefit)/Cost of Wind Repowering with Medium Natural-Gas and Medium CO2Price-Policy Assumptions (2017\$ million), February 2018

Wind Facility	SO Model PVRR(d)	PaR Stochastic- Mean PVRR(d)	PaR Risk-Adjusted PVRR(d)
Glenrock 1	(\$25)	(\$21)	(\$23)
Glenrock 3	(\$8)	(\$7)	(\$7)

1	Q.	Please summarize the project-by-project PVRR(d) results calculated from the
2		SO model and PaR through 2036 when assuming low natural-gas and zero CO_2
3		price-policy assumptions.
4	A.	Table 3 summarizes the PVRR(d) results for each wind facility. The PVRR(d)
5		between cases with and without wind repowering are shown for each wind facility
6		based on system modeling results from the SO model and PaR, before accounting for
7		the substantial increase in incremental energy beyond the 2036 time frame. When
8		applying low natural-gas and zero CO2 price-policy assumptions, costs from
9		repowering the Leaning Juniper wind facility are slightly higher than the benefits. All
10		other wind facilities are projected to deliver net benefits.

Table 3. Project-by-Project SO Model and PaR PVRR(d)(Benefit)/Cost of Wind Repowering with Low Natural-Gas and Zero CO2 Price-
Policy Assumptions (2017\$ million), February 2018

Wind Facility	SO Model PVRR(d)	PaR Stochastic- Mean PVRR(d)	PaR Risk-Adjusted PVRR(d)
Glenrock 1	(\$21)	(\$21)	(\$22)
Glenrock 3	(\$7)	(\$6)	(\$6)
Seven Mile Hill 1	(\$28)	(\$28)	(\$29)

1 Project-by-Project Annual Revenue Requirement Price-Policy Results

- Q. Please summarize the project-by-project PVRR(d) results calculated from the
 change in annual revenue requirement through 2050.
- 4 A. Table 4 summarizes the PVRR(d) results for each wind facility calculated from the
- 5 change in annual nominal revenue requirement through 2050 for both price-policy
- 6 scenarios. Unlike the results summarized in Tables 2 and 3, these results account for
- 7 the substantial increase in incremental energy beyond the 2036 time frame. Each of
- 8 the wind facilities within the scope of the proposed repowering project show net
- 9 benefits with repowering under the medium natural-gas and medium CO₂ price-policy
- 10 scenario and all facilities show net benefits under the low-natural-gas and zero CO₂
- 11 price-policy scenario, except for the Leaning Juniper wind facility, where the benefits
- 12 are equal to the costs.

Wind Facility	Medium Natural-Gas and Medium CO2	Low Natural-Gas and Zero CO2
Glenrock 1	(\$33)	(\$33)
Glenrock 3	(\$11)	(\$6)
Seven Mile Hill 1	(\$41)	(\$40)
Seven Mile Hill 2	(\$10)	(\$6)
High Plains	(\$22)	(\$6)
McFadden Ridge	(\$7)	(\$2)
Dunlap Ranch	(\$39)	(\$23)
Rolling Hills	(\$15)	(\$5)
Leaning Juniper	(\$8)	(\$0)
Marengo 1	(\$50)	(\$22)
Marengo 2	(\$20)	(\$7)
Goodnoe Hills	(\$26)	(\$19)
Total	(\$282)	(\$170)

Table 4. Project-by-Project Nominal Revenue Requirement PVRR(d) (Benefit)/Cost of Wind Repowering (2017\$ million), February 2018

1Q.The project-by-project results vary by wind facility, and some wind facilities2appear to show relatively small PVRR(d) benefits. Have you calculated the net3benefits of the wind repowering project taking into account the size of each wind4facility?

5 A. Yes. The magnitude of the PVRR(d) results must be considered in relation to the 6 specific attributes of the repowered wind facility, including the size of the facility, the 7 expected cost to repower the facility, and the level of annual energy output expected 8 after the new equipment is installed. For example, the PVRR(d) for McFadden Ridge 9 shows a \$7 million benefit when repowered (using medium natural-gas and medium 10 CO₂ price-policy assumptions)—the lowest PVRR(d) among all of the project-by-11 project results. The PVRR(d) benefit for McFadden Ridge is approximately 12 14 percent of the \$50 million benefit for Marengo I, which yields the highest 13 PVRR(d) among all of the project-by-project results. However, the capacity of 14 McFadden Ridge (28.5 MW) is approximately 20 percent of the capacity of Marengo 15 I (140.4 MW). Similarly, the expected energy output after repowering McFadden 16 Ridge (approximately 117 GWh per year) is approximately 24 percent of the expected 17 energy output after repowering Marengo I (approximately 488 GWh per year).

A reasonable metric to evaluate the relative benefits among the wind facilities that captures the specific attributes of each facility is the nominal levelized net benefit per incremental MWh expected after the facility is repowered. This metric captures the specific repowering cost for each facility net of the specific benefits of each facility per incremental MWh of energy expected after the facility is repowered. Table 5 shows the nominal levelized net benefit of repowering per MWh of expected

1	incremental energy output after repowering for each wind facility. When using
2	medium natural-gas and medium CO ₂ price-policy assumptions, Table 5 shows the
3	Seven Mile Hill II facility produces the largest net benefit per incremental MWh
4	(\$36/MWh), and Leaning Juniper produces the smallest net benefit per incremental
5	MWh (\$7/MWh).

Wind Facility	Medium Natural-Gas and Medium CO2	Low Natural-Gas and Zero CO ₂
Glenrock 1	\$29/MWh	\$29/MWh
Glenrock 3	\$28/MWh	\$16/MWh
Seven Mile Hill 1	\$30/MWh	\$29/MWh
Seven Mile Hill 2	\$36/MWh	\$23/MWh
High Plains	\$17/MWh	\$5/MWh
McFadden Ridge	\$17/MWh	\$5/MWh
Dunlap Ranch	\$28/MWh	\$17/MWh
Rolling Hills	\$19/MWh	\$7/MWh
Leaning Juniper	\$7/MWh	\$0/MWh
Marengo 1	\$25/MWh	\$11/MWh
Marengo 2	\$21/MWh	\$8/MWh
Goodnoe Hills	\$26/MWh	\$18/MWh
Weighted Average	\$23/MWh	\$14/MWh

Table 5. Nominal Levelized Net Benefit per MWh of Incremental
Energy Output after Repowering (2017\$/MWh), February 2018

6 Q. Is there an upside to the project-by-project PVRR(d) results?

A. Yes. The project-by-project results do not reflect the potential value of RECs that
will be generated by the incremental energy output from each facility. For instance,
as applied to the Leaning Juniper project discussed above, present-value net customer
benefits would increase by approximately \$1.1 million (approximately 14 percent of
the PVRR(d) benefits under the medium natural-gas and medium CO₂ price-policy
scenario as shown in Table 4) for every dollar assigned to the incremental RECs that

1		will be generated from this facility. Moreover, as noted early in my testimony, the
2		CO ₂ price assumptions used in the economic analysis were inadvertently modeled in
3		2012 real dollars instead of nominal dollars. Consequently, the PVRR(d) net benefits
4		in the medium natural-gas, medium CO ₂ price-policy scenario are conservative.
5	Proje	ct-wide SO and PaR Price-Policy Results
6	Q.	Please summarize the PVRR(d) results for the full scope of the wind repowering
7		project as calculated from the SO model and PaR through 2036 among all nine
8		price-policy scenarios.
9	A.	Table 6 summarizes the PVRR(d) results for each price-policy scenario for the full
10		scope of the wind repowering project. The PVRR(d) between cases with and without
11		the repowering project are shown for the SO model and for PaR. The data used to
12		calculate the PVRR(d) results shown in Table 6 are provided as Exhibit PAC/303.

Table 6. Project-Wide SO Model and PaR PVRR(d)
(Benefit)/Cost of the Wind Repowering Projects (2017\$ million), February 2018

Price-Policy Scenario	SO Model PVRR(d)	PaR Stochastic- Mean PVRR(d)	PaR Risk-Adjusted PVRR(d)
Low Gas, Zero CO ₂	(\$159)	(\$141)	(\$148)
Low Gas, Medium CO ₂	(\$158)	(\$139)	(\$146)
Low Gas, High CO ₂	(\$183)	(\$165)	(\$173)
Medium Gas, Zero CO ₂	(\$201)	(\$171)	(\$180)
Medium Gas, Medium CO ₂	(\$204)	(\$180)	(\$189)
Medium Gas, High CO ₂	(\$215)	(\$193)	(\$203)
High Gas, Zero CO ₂	(\$257)	(\$234)	(\$246)
High Gas, Medium CO ₂	(\$260)	(\$248)	(\$260)
High Gas, High CO ₂	(\$273)	(\$240)	(\$252)

13

Over a 20-year period, the wind repowering project reduces customer costs in all nine price-policy scenarios. This outcome is consistent in both the SO model and

14

1		PaR results. Under the central price-policy scenario, assuming medium natural-gas
2		prices and medium CO ₂ prices, the PVRR(d) net benefits range between
3		\$180 million, when derived from PaR stochastic-mean results, and \$204 million,
4		when derived from SO model results.
5	Q.	What trends do you observe in the modeling results across the different price-
6		policy scenarios?
7	A.	Projected project-wide net benefits increase with higher natural-gas price
8		assumptions, and similarly, generally increase with higher CO ₂ price assumptions.
9		Conversely, project-wide net benefits generally decline when low natural-gas prices
10		and low CO ₂ prices are assumed. This trend holds true when looking at the results
11		from the two simulations used to calculate the PVRR(d) for all nine of the price-
12		policy scenarios. Importantly, both models show that the net benefits from the wind
13		repowering project are robust across a range of price-policy assumptions.
14	Q.	Is there incremental customer upside to the PVRR(d) results calculated from the
15		SO model and PaR through 2036?
16	A.	Yes. The PVRR(d) results presented in Table 6 do not reflect the potential value of
17		RECs generated by the incremental energy output from the repowered facilities.
18		Customer benefits for all price-policy scenarios would improve by approximately
19		\$6 million for every dollar assigned to the incremental RECs that will be generated
20		from the repowered facilities through 2036. Quantifying the potential upside
21		associated with incremental REC revenues is intended simply to communicate that
22		the net benefits from the repowering project would improve if the incremental RECs
23		can be monetized in the market or if those RECs are used to reduce incremental costs

1		associated with meeting state renewable portfolio standard targets. Moreover, as
2		noted earlier in my testimony, the CO ₂ price assumptions used in the economic
3		analysis were inadvertently modeled in 2012 real dollars instead of nominal dollars.
4		Consequently, the PVRR(d) net benefits in the six price-policy scenarios that use
5		medium and high CO ₂ price assumptions are conservative.
6	Q.	Why do the PaR results tend to show a different level of benefits from the wind
7		repowering project when compared to the results from the SO model?
8	A.	The two models assess the system impacts of the wind repowering project in different
9		ways. The SO model is designed to dynamically assess system dispatch, with less
10		granularity than PaR, while optimizing the selection of resources to the portfolio over
11		time. PaR is able to dynamically assess system dispatch, with more granularity than
12		the SO model and with consideration of stochastic risk variables; however, PaR does
13		not modify the type, timing, size, and location of resources in the portfolio in
14		response to its more detailed assessment of system dispatch. In evaluating
15		differences in annual system costs between the two models, PaR's ability to better
16		simulate system dispatch relative to the SO model results in lower benefits from
17		repowering being reported from PaR.
18	Q.	Does one of these two models provide a better assessment of the wind
19		repowering project relative to the other?
20	A.	No. The two models are simply different, and both are useful in establishing a range
21		of wind repowering benefits through the 20-year forecast period. Importantly, the
22		PVRR(d) results from both models show customer benefits across the same set of
23		price-policy scenarios with consistent trends in the difference in PVRR(d) results

1		between price-policy scenarios. The consistency in the trend of forecasted benefits
2		between the two models, each having its own strengths, shows that the wind
3		repowering benefits are robust across a range of price-policy assumptions and when
4		analyzed using different modeling tools.
5	Q.	How do the risk-adjusted PVRR(d) results compare to the stochastic-mean
6		PVRR(d) results?
7	A.	The risk-adjusted PVRR(d) results show slightly greater net benefits than those
8		calculated from the stochastic-mean PVRR(d) results. This indicates that the wind
9		repowering project, which provides incremental zero-fuel-cost energy, provides
10		incremental benefits in reducing the impact of high-cost, low-probability outcomes
11		that can occur due to volatility in stochastic variables like load, wholesale-market
12		prices, hydro generation, and thermal-unit outages.
13	Proje	ct-Wide Annual Revenue Requirement Price-Policy Results
14	Q.	Please summarize the PVRR(d) results for the full scope of the wind repowering
15		project as calculated from the change in annual revenue requirement through
16		2050.
17	A.	Table 7 summarizes the PVRR(d) results for the full scope of the wind repowering
18		project for each price-policy scenario calculated from the change in annual nominal
19		revenue requirement through 2050. The annual data over the period 2017 through
20		2050 that were used to calculate the PVRR(d) results shown in Table 7 are provided
21		as Exhibit PAC/304.

Price-Policy Scenario	Annual Revenue Requirement PVRR(d)
Low Gas, Zero CO ₂	(\$127)
Low Gas, Medium CO ₂	(\$121)
Low Gas, High CO ₂	(\$223)
Medium Gas, Zero CO ₂	(\$224)
Medium Gas, Medium CO ₂	(\$273)
Medium Gas, High CO ₂	(\$321)
High Gas, Zero CO ₂	(\$389)
High Gas, Medium CO ₂	(\$386)
High Gas, High CO ₂	(\$466)

Table 7. Project-Wide Nominal Revenue Requirement PVRR(d)(Benefit)/Cost of Wind Repowering (2017\$ million), February 2018

1		When calculated through 2050, which covers the remaining life of the
2		repowered facilities, the wind repowering project reduces customer costs in all nine
3		price-policy scenarios, with PVRR(d) benefits ranging from \$121 million in the low
4		natural-gas and medium CO2 price-policy scenario to \$466 million in the high
5		natural-gas and high CO ₂ price-policy scenario. Under the central price-policy
6		scenario, assuming medium natural-gas prices and medium CO ₂ prices, the PVRR(d)
7		benefits are \$273 million.
8	Q.	What are the gross customer benefits of the repowering project and how do
9		those gross benefits compare to project costs?
10	А.	Present-value gross customer benefits calculated over the remaining life of the
11		repowered wind facilities range between \$1.14 billion and \$1.48 billion, which
12		compares to present-value project costs totaling \$1.01 billion.

1Q.What causes the increase in PVRR(d) benefits for many of the price-policy2scenarios when calculated from nominal revenue requirement through 20503relative to the PVRR(d) results calculated from the SO model and PaR results4through 2036?

5 The PVRR(d) calculated from estimated annual revenue requirement through 2050 A. 6 picks up the sizable increase in incremental wind energy output beyond the 20-year 7 forecast period analyzed with the SO model and PaR. As discussed earlier in my 8 testimony, the change in wind energy output between cases with and without wind 9 repowering experiences a step change beyond this 20-year period, when the existing 10 wind facilities would otherwise have hit the end of their depreciable life. Beyond the 11 20-year forecast period, the change in wind energy output between cases with and 12 without repowering reflects the full energy output from the repowered wind facilities.

13 Figure 5 shows the incremental change in wind energy output resulting from 14 the repowering project. Incremental energy output associated with wind repowering 15 progressively increases over the 2036-through-2040 period, as wind facilities 16 originally placed in service in the 2006-through-2010 time frame would have 17 otherwise hit the end of their lives. Before 2036, and once all of the wind resources 18 within the project scope are repowered, the average annual incremental increase in 19 wind energy output is approximately 738 GWh. Beyond 2040, and before the new 20 equipment hits the end of its depreciable life, the average annual incremental increase 21 in wind-energy output is approximately 3,478 GWh.

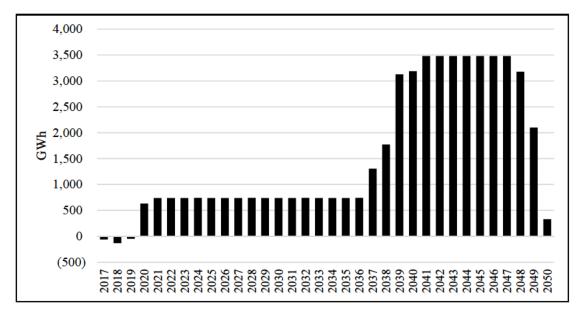

Figure 5. Change in Incremental Wind Energy Output Due to Wind Repowering (GWh), February 2018

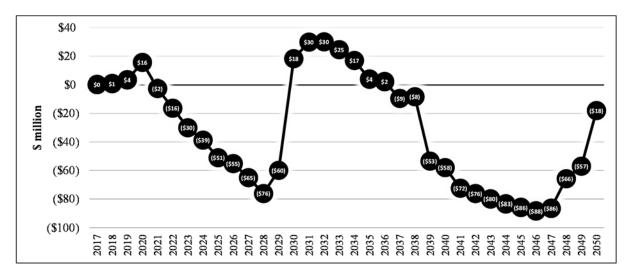

1Q.Is there additional potential upside to the PVRR(d) results calculated from the2change in estimated annual revenue requirement through 2050?

3 A. Yes. As in the case with the PVRR(d) results calculated from the SO model and PaR results through 2036, the PVRR(d) results presented in Table 7 do not reflect the 4 5 potential value of RECs produced by the repowered facilities. Customer benefits for 6 all price-policy scenarios would improve by approximately \$12 million for every 7 dollar assigned to the incremental RECs that will be generated from the wind 8 repowering project through 2050. Moreover, as noted earlier, the CO₂ price 9 assumptions used in the February 2018 economic analysis were inadvertently 10 modeled in 2012 real dollars instead of nominal dollars. Consequently, the PVRR(d) 11 net benefits in the six price-policy scenarios that use medium and high CO₂ price 12 assumptions are conservative.

Q. Please describe the change in annual nominal revenue requirement from the wind repowering project.

3 Figure 6 shows the change in nominal revenue requirement due to the wind A. 4 repowering project for the medium natural-gas, medium CO₂ price-policy scenario on 5 a total-system basis. The change in nominal revenue requirement shown in the figure 6 reflects project costs, including capital revenue requirement (*i.e.*, depreciation, return, 7 income taxes, and property taxes), O&M expenses, the Wyoming wind-production 8 tax, and PTCs. The project costs are netted against system impacts from the wind 9 repowering project, reflecting the change in NPC, emissions, non-NPC variable costs, 10 and system fixed costs that are affected by, but not directly associated with, the wind 11 repowering project.

Figure 6. Total-System Annual Revenue Requirement With the Wind Repowering Project (Benefit)/Cost (2017\$ million), February 2018

12 As this chart shows, the wind repowering project generates substantial near-13 term customer benefits and continues to contribute to customer benefits over the long 14 term. Before repowering, the reduction in wind energy output due to component

1		failures on the existing wind resource equipment is assumed to reduce wind energy
2		output for specific wind turbines until the time new equipment is installed. This
3		contributes to an increase in revenue requirement in 2017 and 2018 (\$1 million to
4		\$4 million, total system). In the February 2018 analysis, all of the facilities were
5		assumed to be repowered in 2019, except the Dunlap facility, which was assumed to
6		be repowered toward the end of 2020. ⁴ Over the 2019-to-2020 time frame, project
7		costs reflecting partial-year capital revenue requirement net of PTCs and system cost
8		impacts cause slight changes to revenue requirement.
9		The wind repowering project reduces revenue requirement soon after the new
10		equipment is placed in service, and from 2021 through 2028, annual revenue
11		requirement is reduced as PTC benefits increase with inflation and the new equipment
12		continues to depreciate. The reduction in annual revenue requirement is \$76 million
13		by 2028. Revenue requirement increases once the PTCs expire toward the end of
14		2030. Annual revenue requirement is reduced over the 2037-through-2050 time
15		frame when, as discussed earlier in my testimony, the incremental wind energy output
16		associated with wind repowering increases substantially.
17	Q.	Did you evaluate how wind repowering benefits assumed beyond 2036 affect the
18		PVRR(d) results calculated from the change in annual nominal revenue
19		requirement through 2050?
20	A.	Yes. The point of extrapolating results beyond 2036 is to capture the benefits from
21		the significant increase in the expected annual energy output from the repowered
22		wind facilities beyond the period in which the existing wind facilities would have

⁴ Based on more current information, both the Dunlap and Glenrock III facilities will be repowered in 2020. As noted elsewhere in my testimony, these facilities are therefore not included in this Schedule 202 filing for 2019.

3	Table 8 summarizes how the PVRR(d) results through 2050 would change if
4	flat market prices at the Palo Verde (PV) market from the December 29, 2017 OFPC
5	were used as the basis to evaluate the value of incremental energy from wind
6	repowering over the 2037-through-2050 time frame. Recognizing there is both
7	upside and downside price risk to the value of this energy, I assume different levels of
8	PV prices—70 percent of the PV forward curve, 100 percent of the PV forward curve,
9	and 130 percent of the PV forward curve. PacifiCorp's December 29, 2017 OFPC
10	includes forward prices through 2042. Conservatively, I assume no escalation in PV
11	prices beyond 2042 for each of these scenarios. Each of these scenarios is shown
12	alongside the \$273 million PVRR(d) net benefit when incremental energy from
13	repowering beyond 2036 is calculated from system modeling results over the 2028
14	through 2036 time frame.

Source of 2037-2050 Benefits	Nominal Levelized Benefit from 2037-2050 (\$/MWh)	Annual Revenue Requirement PVRR(d) (Benefit)/Cost (\$ million)
2027-2036 System Modeling	\$59.08	(\$273)
70% of PV	\$49.49	(\$213)
100% of PV	\$70.70	(\$351)
130% of PV	\$91.92	(\$489)

Table 8. Long-Term Benefit Sensitivity, February 2018

15

16

17

This analysis demonstrates that regardless of the methodology used to extend wind repowering benefits to 2050, the PVRR(d) result shows significant customer savings. If the incremental energy is valued at the PV forward curve, the PVRR(d) benefits of the wind repowering project are \$351 million, which is \$78 million higher
 than the methodology used in my analysis.

3 New Wind and Transmission Sensitivity

4 Q. Did PacifiCorp produce any sensitivities on its economic analysis of the wind 5 repowering project?

- 6 Yes. In the February 2018 analysis, PacifiCorp developed a sensitivity to quantify A. 7 how the net benefits of wind repowering are affected when combined with 1,170 MW 8 of new Wyoming wind resources and the Aeolus-to-Bridger/Anticline transmission 9 included in the company's 2017 IRP.⁵ This sensitivity was based on the assumption 10 that the new wind and transmission would be operational by the end of 2020. 11 **Q**. Please summarize the results of the sensitivity that includes new Wyoming wind 12 resources and the planned Aeolus-to-Bridger/Anticline transmission project. 13 A. Table 9 summarizes the PVRR(d) results for the new wind sensitivity that assumes 14 wind repowering is implemented in combination with adding 1,170 MW of new 15 Wyoming wind and the Aeolus-to-Bridger/Anticline transmission project. This 16 sensitivity was developed using SO model and PaR simulations through 2036 for the 17 medium natural-gas, medium CO₂ and the low natural-gas, zero CO₂ price-policy 18 scenarios. The results are shown alongside the base repowering study presented 19 above in which wind repowering was evaluated without the new wind and
- 20 transmission

⁵ The 2017 IRP assumed 1,100 MW of new Wyoming wind by the end of 2020. After filing the 2017 IRP, PacifiCorp issued its 2017R RFP and initially identified 1,170 MW of new Wyoming wind to the final shortlist, which served as the basis for this sensitivity. PacifiCorp later updated its 2017R RFP final shortlist to include 1,150 MW of new Wyoming wind.

	Sensitivity (Repowering + New Wind & Trans.) PVRR(d)	Base Study (Repowering) PVRR(d)	Change in PVRR(d)
Medium Gas, Mediun	n CO ₂		
SO Model	(\$532)	(\$204)	(\$328)
PaR Stochastic Mean	(\$466)	(\$180)	(\$286)
PaR Risk Adjusted	(\$489)	(\$189)	(\$300)
Low Gas, Zero CO2	· · ·		-
SO Model	(\$301)	(\$159)	(\$142)
PaR Stochastic Mean	(\$300)	(\$141)	(\$159)
PaR Risk Adjusted	(\$315)	(\$148)	(\$167)

Table 9. New Wind and Aeolus-to-Bridger/Anticline Sensitivity(Benefit)/Cost of Wind Repowering (2017\$ million), February 2018

1 Customer benefits increase significantly when the wind repowering project is 2 implemented with the new wind and transmission in both the medium natural-gas, 3 medium CO₂ and the low natural-gas, zero CO₂ price-policy scenarios. These results 4 demonstrate that customer benefits not only persist, but increase, if both the wind 5 repowering project and the new wind and transmission projects are completed.

6

AUGUST 2018 WIND REPOWERING ANALYSIS

7 Project-by-Project SO and PaR Model Price-Policy Results

8 Q. Please summarize the scope of the approach taken in the August 2018 analysis, 9 relative to the February 2018 analysis, including the price-policy scenarios used. 10 A. For the August 2018 analysis, PacifiCorp performed a project-by-project economic 11 analysis that was updated to account for more current modeling assumptions, using 12 the same basic methodology used in the February 2018 analysis: SO model and PaR 13 studies through 2036 (levelized capital and nominal treatment of PTCs); and nominal 14 revenue requirement analysis through 2050 (nominal capital and nominal treatment of

1		PTCs). PacifiCorp performed the updated analysis in August 2018 for each facility
2		using medium natural gas and medium CO2 price-policy assumptions.
3		For Leaning Juniper, PacifiCorp also performed an updated analysis in August
4		2018 using the most conservative low natural gas and zero CO ₂ price-policy
5		assumptions. This additional price-policy scenario was analyzed for the Leaning
6		Juniper facility because its cost-and-performance assumptions had improved relative
7		to the February 2018 analysis where Leaning Juniper presented the lowest customer
8		net benefits relative to other wind facilities.
9	Q.	How did the cost-and-performance assumptions change for Leaning Juniper in
10		the August 2018 analysis relative to the February 2018 analysis?
11	A.	After evaluating alternative equipment suppliers, the capital cost required to repower
12		Leaning Juniper was reduced by approximately from to
13		and the expected increase in annual energy output increased from
14		percent to percent.
15	Q.	Please summarize the project-by-project PVRR(d) results calculated from the
16		SO model and PaR through 2036 when assuming medium natural-gas and
17		medium CO ₂ price-policy assumptions.
18	A.	Table 10 summarizes the PVRR(d) results for each wind facility. ⁶ The PVRR(d)
19		between cases with and without wind repowering are shown for each wind facility
20		based on system modeling results from the SO model and PaR, before accounting for
21		the substantial increase in incremental energy beyond the 2036 time frame. When

⁶ With the passage of time between the February 2018 and August 2018 analyses, PVRR(d) results from the August 2018 analysis are discounted back to 2018 dollars. Results from the February 2018 analysis are discounted back to 2017 dollars.

- 1 applying medium natural-gas and medium CO₂ price-policy assumptions, all wind
- 2 facilities are projected to deliver net benefits.

Table 10. Project-by-Project SO Model and PaR PVRR(d)(Benefit)/Cost of Wind Repowering with Medium Natural-Gas and Medium CO2Price-Policy Assumptions (2018\$ million); August 2018

Wind Facility	SO Model PVRR(d)	PaR Stochastic- Mean PVRR(d)	PaR Risk-Adjusted PVRR(d)

3 Q. How do the August 2018 results in Table 10 compare with February 2018 results

4 assuming medium natural-gas and medium CO₂ price-policy assumptions?

- A. Using the medium natural-gas and medium CO₂ price-policy assumptions, the August
 2018 project-by-project PVRR(d) results calculated from the SO and PaR models
 through 2036 are similar to, and generally improve upon, projected customer benefits
 relative to the February 2018 project-by-project PVRR(d) results.⁷ Table 11 displays
- 9 the two sets of analyses side by side. These results confirm that with updated

⁷ As discussed further below, a particularly notable change is evident for Leaning Juniper. This facility was projected in February 2018 to provide net zero customer benefits, but with improved cost-and-performance assumptions applied in the August 2018 analysis is projected to provide \$10 million in net positive customer benefits.

- 1 assumptions, the conclusions from the February 2018 study—implementing the
- 2 repowering project will provide substantial customer benefits—remain valid.

Table 11. Project-by-Project SO Model and PaR PVRR(d)(Benefit)/Cost of Wind Repowering with Medium Natural-Gas and Medium CO2Price-Policy Assumptions (\$ million); February and August 2018

3 Q. Please summarize the PVRR(d) results for the Leaning Juniper facility

4 calculated from the SO model and PaR through 2036 when assuming low

- 5
- natural-gas and zero CO₂ price-policy assumptions.
- 6 A. Table 12 summarizes the PVRR(d) results for the Leaning Juniper facility when
- 7 applying low natural-gas and zero CO₂ price-policy assumptions. Results, which
- 8 represent the PVRR(d) between cases with and without repowering the Leaning
- 9 Juniper facility, are shown alongside those reported from the February 2018 analysis.
- 10 The PVRR(d) results in Table 12 are from the SO model and PaR, before accounting

- 1 for the substantial increase in incremental energy beyond the 2036 time frame. Under
- 2 this most conservative price-policy scenario, the Leaning Juniper facility is still
- 3 projected to deliver net benefits, and driven by improved cost-and-performance
- 4 assumptions, these net benefits improve relative to the February 2018 PVRR(d)
- 5 results. These results confirm that with updated assumptions, implementing the entire
- 6 repowering project, including at the Leaning Juniper facility, will provide customer
- 7 benefits and is therefore prudent.

Table 12. Leaning Juniper SO Model and PaR PVRR(d)(Benefit)/Cost of Wind Repowering with Low Natural-Gas and Zero CO2 Price-Policy Assumptions (\$ million); February and August 2018

Wind Facility	SO Model		PaR Stochastic-Mean		PaR Risk-Adjusted	
	PVRR(d)		PVRR(d)		PVRR(d)	
	February 2018	August 2018	February 2018	August 2018	February 2018	August 2018
	(2017\$)	(2018\$)	(2017\$)	(2018\$)	(2017\$)	(2018\$)
Leaning Juniper	\$6	(\$5)	\$3	(\$4)	\$4	(\$4)

8 Q. Is there incremental customer upside to the PVRR(d) results calculated from the

9 SO model and PaR through 2036?

- 10 A. Yes. As is the case for the February 2018 analysis, the PVRR(d) results presented in
- 11 Tables 10 and 12 do not reflect the potential value of RECs generated by the
- 12 incremental energy output from the repowered facilities.

13 Project-by-Project Annual Revenue Requirement Price-Policy Results

14 Q. Please summarize the project-by-project PVRR(d) results calculated from the

15 change in annual revenue requirement through 2050.

- 16 A. Table 13 summarizes the PVRR(d) results for each wind facility calculated from the
- 17 change in annual nominal revenue requirement through 2050 for the medium natural-

1gas and medium CO2 price-policy scenario. Unlike the results summarized in Table210, these results account for the substantial increase in incremental energy beyond the32036 time frame. Each of the wind facilities within the scope of the proposed4repowering project show net benefits with repowering under the medium natural-gas5and medium CO2 price-policy scenario.

Table 13. Project-by-Project Nominal Revenue Requirement PVRR(d)(Benefit)/Cost of Wind Repowering (2018\$ million), with Medium Natural-Gas
and Medium CO2 Price-Policy Assumptions; August 2018

Wind Facility	Nom. Rev. Req. PVRR(d) (Benefit)/Cost
Glenrock 1	(\$35)
Glenrock 3	(\$10)
Seven Mile Hill 1	(\$43)
Seven Mile Hill 2	(\$9)
High Plains	(\$19)

Dunlap Ranch	(\$39)
Rolling Hills	(\$15)
Leaning Juniper	(\$21)
Marengo 1	(\$46)
Marengo 2	(\$17)
Goodnoe Hills	(\$25)

6 Q. How do the August 2018 results in Table 13 compare with the February 2018

7

analysis assuming medium natural-gas and medium CO₂ price-policy

8 assumptions?

9 A. Using the medium natural-gas and medium CO₂ price-policy assumptions, the August

- 10 2018 project-by-project PVRR(d) results calculated from change in annual nominal
- 11 revenue requirement through 2050 are similar to the February 2018 results. Table 14

1	displays the two sets of analyses side by side. These results confirm that with
2	updated assumptions, the conclusions from the February 2018 study-implementing
3	the repowering project will provide substantial customer benefits-remain valid.

Table 14. Project-by-Project Nominal Revenue Requirement PVRR(d) (Benefit)/Cost of Wind Repowering (\$ million), with Medium Natural-Gas and Medium CO₂ Price-Policy Assumptions; February and August 2018

Wind Facility	Nom. Rev. Req. PVR	R(d) (Benefit)/Cost
	February 2018 (2017\$)	August 2018 (2018\$)

Marengo 2	(\$20)	(\$17)
Goodnoe Hills	(\$26)	(\$25)

4	Q .	Please summarize the PVRR(d) results for the Leaning Juniper facility
	· ·	

calculated from the change in annual revenue requirement through 2050 when
 assuming low natural-gas and zero CO₂ price-policy assumptions.

A. Table 15 summarizes the PVRR(d) results for the Leaning Juniper facility when
applying low natural-gas and zero CO₂ price-policy assumptions. Results, which
represent the PVRR(d) between cases with and without repowering the Leaning
Juniper facility, are shown alongside those reported from the February 2018 analysis.
The PVRR(d) results in Table 15 are based on system modeling results from the

1	change in annual revenue requirement through 2050. Under this most conservative
2	price-policy scenario, the Leaning Juniper facility is still projected to deliver net
3	benefits, and driven by improved cost-and-performance assumptions, these net
4	benefits improve relative to the February 2018 PVRR(d) results. These results
5	confirm that with updated assumptions, implementing the entire repowering project,
6	including at the Leaning Juniper facility, will provide customer benefits and is
7	therefore prudent.

Table 15. Leaning Juniper Nominal Revenue Requirement PVRR(d)(Benefit)/Cost of Wind Repowering (\$ million), with Low Natural-Gas and ZeroCO2 Price-Policy Assumptions; February and August 2018

Wind Facility	Nom. Rev. Req. PVI	RR(d) (Benefit)/Cost
	February 2018 (2017\$)	August 2018 (2018\$)
Leaning Juniper	(\$0)	(\$4)

8 Q. Have you calculated the net benefits of the wind repowering project taking into

9 account the size of each wind facility?

10 A. Yes. As discussed above, the metric of nominal levelized net benefit per incremental 11 MWh expected after the facility is repowered captures the specific repowering cost 12 for each facility net of the specific benefits of each facility per incremental MWh of 13 energy expected after the facility is repowered. Table 16 shows the nominal levelized 14 net benefit of repowering per MWh of expected incremental energy output after 15 repowering each wind facility. When using medium natural-gas and medium CO₂ 16 price-policy assumptions, Table 16 shows the Glenrock 1, Seven Mile Hill 1, and 17 Seven Mile Hill 2 facilities produce the largest net benefit per incremental MWh

- 1 (\$29/MWh), and McFadden Ridge produces the smallest net benefit per incremental
- 2 MWh (\$12/MWh).

Table 16. Project-by-Project Nominal Levelized Net Benefit per MWh of Incremental Energy Output after Repowering (2018\$/MWh), with Medium Natural-Gas and Medium CO₂ Price-Policy Assumptions; August 2018

Wind Facility	Nom. Lev. \$/MWh
Glenrock 1	\$29/MWh
Glenrock 3	\$25/MWh
Seven Mile Hill 1	\$29/MWh
Seven Mile Hill 2	\$29/MWh
High Plains	\$14/MWh
McFadden Ridge	\$12/MWh
Dunlap Ranch	\$27/MWh
Rolling Hills	\$17/MWh
Leaning Juniper	\$17/MWh
Marengo 1	\$21/MWh
Marengo 2	\$17/MWh
Goodnoe Hills	\$23/MWh

Q. How do the August 2018 results in Table 16 compare with the prior analysis in February 2018 assuming medium natural-gas and medium CO₂ price-policy assumptions?

A. Using the medium natural-gas and medium CO₂ price-policy assumptions, the August
2018 project-by-project metrics for nominal levelized net benefit per incremental
MWh expected after the facility is repowered are similar to the February 2018 results
under the same price-policy scenario. Table 17 displays the two sets of analyses side
by side. These results confirm that with updated assumptions, the conclusions from
the February 2018 study—implementing the repowering project will provide
substantial customer benefits—remain valid.

Wind Facility	Nom. Lev	v. \$/MWh
	February 2018	August 2018
Glenrock 1	\$29/MWh	\$29/MWh
Glenrock 3	\$28/MWh	\$25/MWh
Seven Mile Hill 1	\$30/MWh	\$29/MWh
Seven Mile Hill 2	\$36/MWh	\$29/MWh
High Plains	\$17/MWh	\$14/MWh
McFadden Ridge	\$17/MWh	\$12/MWh
Dunlap Ranch	\$28/MWh	\$27/MWh
Rolling Hills	\$19/MWh	\$17/MWh
Leaning Juniper	\$7/MWh	\$17/MWh
Marengo 1	\$25/MWh	\$21/MWh
Marengo 2	\$21/MWh	\$17/MWh
Goodnoe Hills	\$26/MWh	\$23/MWh

Table 17. Project-by-Project Nominal Levelized Net Benefit per MWh of Incremental Energy Output after Repowering (\$/MWh), with Medium Natural-Gas and Medium CO₂ Price-Policy Assumptions; Feb. and Aug. 2018

1 Q. Is there an upside to the project-by-project PVRR(d) results?

A. Yes. As is the case for the February 2018 analysis, these project-by-project results do
not reflect the potential value of RECs that will be generated by the incremental
energy output from each facility.

5

CONCLUSION

6 Q. Please summarize the conclusions of your testimony.

7 A. PacifiCorp's analysis supports repowering approximately 999.1 MW of existing wind

- 8 resource capacity located in Wyoming, Oregon, and Washington, which includes the
- 9 nine facilities included in this 2019 Schedule 202 filing. The repowered wind
- 10 facilities will qualify for an additional 10 years of federal PTCs, produce more
- 11 energy, reset the 30-year depreciable life of the assets, and reduce run-rate operating

1		costs. The economic analysis of the wind repowering project demonstrates that net
2		benefits, which include federal PTC benefits, NPC benefits, other system variable-
3		cost benefits, and system fixed-cost benefits, more than outweigh net project-wide
4		costs.
5	Q.	What do you recommend?
6	A.	As supported by the economic analyses described in my testimony, I recommend the
7		Commission determine that the decision to repower certain wind facilities in 2019 is
8		prudent and approve this Schedule 202 filing requesting the proposed ratemaking
9		treatment for the new costs of the wind repowering project.
10	Q.	Does this conclude your direct testimony?

11 A. Yes.

Exhibit PAC/401—Annual RAC Repowering Revenue Requirement

Exhibit PAC/402—Monthly RAC Repowering Revenue Requirement – October 2019

Exhibit PAC/403—Monthly RAC Repowering Revenue Requirement – December 2019

Exhibit PAC/404—Capital Structure, Property Tax, Revenue Requirement Gross-up

1	Q.	Please state your name, business address, and present position with PacifiCorp.
2	A.	My name is Steven R. McDougal, and my business address is 1407 W. North Temple,
3		Suite 330, Salt Lake City, Utah 84116. My present position is Director of Revenue
4		Requirements.
5		QUALIFICATIONS
6	Q.	Please describe your education and professional background.
7	A.	I received a Master of Accountancy from Brigham Young University with an
8		emphasis in Management Advisory Services and a Bachelor of Science degree in
9		Accounting from Brigham Young University. In addition to my formal education, I
10		have also attended various educational, professional, and electric industry-related
11		seminars. I have been employed with PacifiCorp and its predecessor, Utah Power
12		and Light Company, since 1983. My experience includes various positions with
13		regulation, finance, resource planning, and internal audit.
14	Q.	What are your current responsibilities with PacifiCorp?
15	A.	My primary responsibilities include overseeing the calculation and reporting of the
16		company's regulated earnings and revenue requirement, assuring that the
17		interjurisdictional cost allocation methodology is correctly applied, and explaining
18		those calculations to regulators in the jurisdictions in which the company operates.
19		PURPOSE OF TESTIMONY
20	Q.	What is the purpose of your testimony in this proceeding?
21	A.	I present and explain the calculation of the repowered wind projects' non-transition
22		adjustment mechanism related revenue requirement to be included in the Renewable
23		Adjustment Clause (RAC). Specifically, my testimony:

1		• Describes the proposed ratemaking for the repowered wind projects;
2 3		• Calculates the Oregon allocated incremental operating expenses and capital revenue requirement cost associated with wind repowering;
4 5 6		• Specifies the amounts that the company requests to recover through the RAC attributable to the revenue requirement changes associated with each of the company's proposed RAC rate change effective dates; and
7 8		• Explains the proposed accounting treatment of the replaced wind plant investment.
9		SUMMARY OF TESTIMONY
10	Q.	Please summarize your testimony.
11	А.	In this RAC filing, PacifiCorp seeks recovery of the non-transition adjustment
12		mechanism Oregon-allocated revenue requirement associated with repowering the
13		company's existing fleet of wind resources. PacifiCorp proposes to implement the
14		RAC in two stages: October 1, 2019, and December 1, 2019, to recover costs in a
15		manner that will coincide with the customer benefits from net power cost and
16		production tax credits included in the 2019 transition adjustment mechanism (TAM).
17		The requested RAC recovery amounts are \$16.0 million, through rates effective
18		October 1, 2019, and an additional \$20.8 million, through rates effective December 1,
19		2019.
20		PROPOSED RATEMAKING
21	Q.	Please explain PacifiCorp's proposed ratemaking for inclusion of the repowered
22		wind projects in rates.
23	А.	PacifiCorp seeks recovery of the revenue requirement associated with the costs of the
24		repowered wind projects that are scheduled to be completed in 2019 through this
25		RAC filing. Cost benefits associated with repowering have been approved as part of

1		PacifiCorp's 2019 TAM. ¹ PacifiCorp proposes two rate effective dates of October 1,
2		2019 and December 1, 2019, for implementing the proposed rate changes. These
3		proposed dates will allow for the natural grouping of the revenue requirement
4		changes for the repowered wind projects that have achieved final completion as of the
5		respective rate effective dates, minimizing potential regulatory lag and maximizing
6		the matching of costs and benefits.
7	Q.	Please identify the wind repowering projects included in each of the proposed
8		RAC rate effective dates of October 1, 2019 and December 1, 2019.
9	A.	The October 1, 2019 rate effective date will include the repowering projects for
10		Leaning Juniper, Seven Mile Hill I, Seven Mile Hill II, and Glenrock I. The
11		December 1, 2019 rate effective date will include the repowering projects for
12		Goodnoe Hills, High Plains, McFadden Ridge, Marengo I and Marengo II.
13	Q.	Do these two rate effective dates include all future repowering projects that
14		PacifiCorp anticipates seeking rate recovery for?
15	A.	No. Glenrock III and Dunlap repowering projects will not be completed until 2020.
16		As such, these projects did not have net power cost benefits, including PTC benefits,
17		reflected in the 2019 TAM. PacifiCorp will seek additional RAC rate recovery for
18		those projects at a later time.

¹ See In the Matter of PacifiCorp dba Pacific Power 2019 Transition Adjustment Mechanism, Docket No. UE 339, Order No. 18-421 (Oct. 26, 2018).

1	Q.	Does PacifiCorp have any wind repowering projects that it will not seek
2		recovery of through the RAC?
3	A.	Yes. The Rolling Hills wind resource is not currently included in Oregon rates;
4		therefore, PacifiCorp will not seek recovery of the Rolling Hills repowering project in
5		the RAC.
6	Q.	If wind projects are repowered before the rate effective dates of October 1, 2019
7		and December 1, 2019, is PacifiCorp proposing to defer the costs associated with
8		these early completions and amortize those changes at a future time?
9	A.	No. PacifiCorp is proposing that only the costs of completed repowering projects as
10		of the rate effective dates be considered in the RAC rate adjustments.
11		REVENUE REQUIREMENT
12	Q.	Have you prepared exhibits that show the calculation of the proposed RAC rate
13		adjustments for each of the rate effective dates, October 1, 2019, and December
14		1, 2019?
15	A.	Yes. Please refer to Exhibit PAC/401, which shows the annual revenue requirement
16		of the incremental capital and operating costs associated with the repowering of
17		Leaning Juniper, Seven Mile Hill I, Seven Mile Hill II, and Glenrock I for the one-
18		year period October 1, 2019 through September 30, 2020. These projects are
19		scheduled to achieve final turbine commissioning before October 1, 2019. As
20		calculated in Exhibit PAC/401, PacifiCorp is seeking an annual recovery of \$16.0
21		million through the RAC with a proposed effective date of October 1, 2019.
22		Exhibit PAC/401 also shows the annual revenue requirement of the
23		incremental capital and operating costs associated with the repowering of Goodnoe

1		Hills, High Plains, McFadden Ridge, Marengo I and Marengo II for the one-year
2		period December 1, 2019 through November 30, 2020. These projects are scheduled
3		to achieve final turbine commissioning before December 1, 2019. As calculated in
4		Exhibit PAC/401, PacifiCorp is seeking an annual recovery of \$20.8 million through
5		the RAC with a proposed effective date of December 1, 2019.
6	Q.	How are the revenue requirement costs allocated to Oregon?
7	A.	All costs excluding property tax are allocated using the 2019 forecast System
8		Generation factor used in the 2019 TAM filing. Property tax is allocated using the
9		Gross Plant System factor from PacifiCorp's December 2017 Results of Operations
10		filing, consistent with the calculation of the average Oregon property tax rate also
11		from the December 2017 Results of Operations filing, addressed later in my
12		testimony.
13	Q.	Please describe the revenue requirement components included in Exhibit
14		PAC/401.
15	A.	The plant revenue requirement consists of the incremental pre-tax rate of return on
16		average net rate base, operation and maintenance expense, depreciation, property
17		taxes, and wind tax. Net power cost and production tax credits are excluded from the
18		RAC and were instead included in the 2019 TAM filing. Through the combination of
19		the TAM and the RAC, the benefits and costs of repowering will be incorporated into
20		customer rates.
21		Net rate base is calculated using a 13-month average of gross plant less
22		accumulated depreciation and accumulated deferred income tax balances. The
23		13-month average balances are derived from the period October 1, 2019 through

1		October 1, 2020, and December 1, 2019 through December 1, 2020, for the rate
2		effective dates of October 1, 2019 and December 1, 2019, respectively. Exhibits
3		PAC/402 and PAC/403 provide the monthly detail used to derive the 13-month
4		averages.
5	Q.	Please describe the capital structure and pre-tax cost of capital proposed in the
6		RAC.
7	A.	Please refer to Exhibit PAC/404. The capital structure and capital costs are taken
8		from the company's December 2017 Results of Operations filing, reflecting the
9		currently authorized capital structure and capital costs approved as part of
10		PacifiCorp's last Oregon general rate case. ² The cost of capital is grossed up to a pre-
11		tax rate of return using the consolidated tax rate consistent with current tax law.
12	Q.	Does the operation and maintenance expense (O&M) shown in Exhibit PAC/401
13		represent the incremental O&M associated with repowering the various wind
14		resources?
15	A.	Yes. The O&M is incremental to repowering and is explained in the testimony of
16		Mr. Timothy Hemstreet, Exhibit PAC/200.
17	Q.	Please explain the depreciation expense in Exhibit PAC/401.
18	A.	The depreciation expense shown in Exhibit PAC/401 is the increased depreciation
19		expense associated with the incremental capital investment placed in service due to
20		repowering.

² See In the Matter of PacifiCorp dba Pacific Power Request for a General Rate Revision, Docket No. UE 263, Order No. 13-474 (Dec. 18, 2013).

1	Q.	Does this incremental depreciation expense include the impact of the change in
2		depreciation expense associated with the equipment replaced during the
3		repowering construction activities?
4	A.	No. The asset value of the replaced wind plant is addressed in the 2018 Depreciation
5		Study filed in docket UM 1968. ³ The depreciation expense included in the RAC has
6		been calculated using currently approved depreciation rates.
7	Q.	Please describe the property tax calculation included in the proposed RAC.
8	A.	Please refer to Exhibit PAC/404, which shows the calculation of the average Oregon
9		property tax rate from PacifiCorp's December 2017 Results of Operations filing. The
10		average property tax rate is calculated by dividing the Oregon allocated property
11		taxes by the Oregon allocated net electric plant in service (EPIS). The property taxes
12		attributable to repowering are calculated by multiplying this average property tax rate
13		by the preceding year's December ending net EPIS of the repowering project.
14	Q.	Please describe the Wyoming Wind Tax included in the proposed RAC.
15	A.	The current Wyoming State tax collection of \$1/MWh wind tax has been applied to
16		the incremental change in Wyoming wind generation as a result of repowering. The
17		amount of incremental wind generation due to repowering is addressed in the
18		testimony of Mr. Hemstreet, Exhibit PAC/200.
19	Q.	Are there any other cost considerations that should be addressed as part of the
20		wind repowering RAC?
21	A.	Yes. The RAC revenue requirement adjustment includes a gross-up for the
22		incremental rate burden associated with incremental franchise taxes, bad debt

³ See In the Matter of PacifiCorp dba Pacific Power Application for Authority to Implement Revised Depreciation Rates, Docket No. UM 1968, (Sep. 13, 2018).

1		expense, resource suppliers tax, and public utility commission fees. These costs have
2		been included in Exhibit PAC/401.
3		REQUEST FOR RECOVERY OF REPOWERING COSTS
4	Q.	What is the amount of rate adjustment that PacifiCorp is requesting through the
5		RAC?
6	A.	PacifiCorp is requesting an annualized amount of \$16.0 million through the RAC
7		rates proposed to be effective October 1, 2019, to recover the repowering capital and
8		operating revenue requirement concurrent with the rate reductions provided through
9		the TAM for the repowering net power cost and production tax credit benefits.
10		Additionally, PacifiCorp is requesting an annualized amount of \$20.8 million,
11		in addition to the October 1, 2019 adjustment, through the RAC rates proposed to be
12		effective December 1, 2019, to recover the second tranche of revenue requirement
13		associated with the next block of repowered wind turbines. PacifiCorp will update
14		these costs consistent with the requirements of Order No. 07-572. ⁴
15	Q.	Does this conclude your direct testimony?
16	А.	Yes.

⁴ In the Matter of Public Utility Commission of Oregon Investigation of Automatic Adjustment Clause Pursuant to SB 838, Docket No. UM 1330, Order No. 07-572 at 4 (Dec. 19, 2007).

PURPOSE OF TESTIMONY	1
SUMMARY OF TESTIMONY	1
RATES AND TARIFF	2
COMPARISON OF PRESENT AND PROPOSED RATES	4

ATTACHED EXHIBITS

Exhibit PAC/501—Renewable Adjustment Clause, Rate Spread and Rate Calculation

Exhibit PAC/502—Proposed Tariff Schedule 202, Renewable Adjustment Clause

Exhibit PAC/503—Estimated Effect of Proposed Price Changes

Exhibit PAC/504—Monthly Billing Comparisons for October 1

Exhibit PAC/505—Monthly Billing Comparisons for December 1

1	Q.	Please state your name, business address, and present position with PacifiCorp.
2	A.	My name is Judith M. Ridenour. My business address is 825 NE Multnomah Street,
3		Suite 2000, Portland, Oregon 97232. My current position is Specialist, Pricing and
4		Cost of Service, in the regulation department.
5		QUALIFICATIONS
6	Q.	Briefly describe your education and professional experience.
7	A.	I have a Bachelor of Arts degree in Mathematics from Reed College. I joined the
8		company in the regulation department in October 2000. I assumed my present
9		responsibilities in May 2001. In my current position, I am responsible for the
10		preparation of rate design used in retail price filings and related analyses. Since 2001,
11		with levels of increasing responsibility, I have analyzed and implemented rate design
12		proposals throughout the company's six-state service territory.
13		PURPOSE OF TESTIMONY
14	Q.	What is the purpose of your testimony in this proceeding?
15	A.	I present the company's proposed Renewable Adjustment Clause (RAC) prices and
16		proposed tariff changes. I also provide a summary of the impact of the proposed rate
17		changes on customers' bills.
18		SUMMARY OF TESTIMONY
19	Q.	Please summarize your testimony.
20	A.	I show that the proposed RAC results in an overall rate increase of \$16.0 million or
21		1.2 percent on October 1, 2019, followed by an incremental increase of \$20.8 million
22		or 1.6 percent on December 1, 2019. The rate impact varies by customer class with
23		rate spread based on present generation revenues. The total bill increase for the

1		average residential customer resulting from both RAC rate changes is \$2.69 per
2		month.
3		RATES AND TARIFF
4	Q.	Please describe the company's tariff rate schedule that collects the RAC
5		adjustment from customers.
6	A.	The company's Schedule 202, Renewable Adjustment Clause, describes the RAC and
7		contains the per kilowatt-hour adjustments applied to customers' bills. The current
8		tariff rates were set to zero in 2010 when the amounts previously collected through
9		the rate schedule were incorporated into base rates as part of the company's general
10		rate case, docket UE 210.
11	Q.	What is the total repowering revenue requirement PacifiCorp is seeking
12		recovery for at this time?
13	A.	As described in the testimony of Mr. Steven R. McDougal, the requested RAC
14		recovery amounts are \$16.0 million, through rates effective October 1, 2019, and an
15		additional \$20.8 million, through rates effective December 1, 2019.
16	Q.	What basis is used for the RAC rate spread?
17	A.	The special conditions in Schedule 202 provide that "Costs recovered through the rate
18		schedule will be allocated across customer classes using the applicable forecasted
19		energy on the basis of an equal percent of generation revenue applied on a cents per
20		kilowatt-hour to each applicable rate schedule." ¹

¹ PacifiCorp rate schedule 202, Renewable Adjustment Clause, Supply Service Adjustment page 2, special condition 3.

1		The company calculated a generation rate spread based on the applicable
2		forecast energy and generation revenue from the most recent Transition Adjustment
3		Mechanism filing, docket UE 339, for a 2019 test year.
4	Q.	Have you calculated proposed RAC per kilowatt-hour adjustment rates by rate
5		schedule?
6	A.	Yes. Exhibit PAC/501 shows the rate spread and the calculation of the RAC rates for
7		both the October 1, 2019 and December 1, 2019 price changes. The rates to collect
8		the December 1 revenue requirement have been calculated separately and added to
9		the October 1 rates to show the total combined rates for the tariff to be effective
10		December 1.
11	Q.	Have you updated the rate schedule to reflect the change in applicability to
12		direct access customers as described in the testimony of Ms. Etta Lockey?
12 13	A.	direct access customers as described in the testimony of Ms. Etta Lockey? Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct
	A.	
13	A.	Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct
13 14	A.	Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct access customers since these customers receive the benefit of the production tax
13 14 15	A.	Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct access customers since these customers receive the benefit of the production tax credits for these resources through the transition adjustments. Exhibit PAC/502
13 14 15 16	A.	Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct access customers since these customers receive the benefit of the production tax credits for these resources through the transition adjustments.  13 14 15 16 17 18 		Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct access customers since these customers receive the benefit of the production tax credits for these resources through the transition adjustments. Exhibit PAC/502 contains the proposed revisions to Schedule 202, Renewable Adjustment Clause. The applicability section has been revised to reflect this change and the list of applicable rate schedules has been updated to include direct access delivery service schedules.
 13 14 15 16 17 18 19 	Q.	Yes. As described by Ms. Etta P. Lockey, the RAC adjustment should apply to direct access customers since these customers receive the benefit of the production tax credits for these resources through the transition adjustments. Exhibit PAC/502 contains the proposed revisions to Schedule 202, Renewable Adjustment Clause. The applicability section has been revised to reflect this change and the list of applicable rate schedules has been updated to include direct access delivery service schedules. Does the company propose any other changes to the rate schedule?

Direct Testimony of Judith M. Ridenour

1		Commission. This will accommodate the timeline requested in this application
2		without modifying the existing language for future RAC filings.
3		Second, PacifiCorp proposes a housekeeping edit to remove from the Purpose
4		section outdated language referencing OAR 860-022-0041. This housekeeping edit is
5		appropriate because the OAR was repealed following the enactment of Senate Bill
6		967 in 2011 in the rulemaking docketed as AR 553.
7	Q.	What rates are reflected in the tariff in Exhibit PAC/502?
8	A.	The proposed tariff in Exhibit PAC/502 includes the proposed rates for October 1.
9		For rates effective December 1, 2019, the company proposes to file a
10		compliance filing updating Schedule 202 with the total December 1 rates shown in
11		Exhibit PAC/501. The compliance filing would be made on or before November 1,
12		2019.
13		COMPARISON OF PRESENT AND PROPOSED RATES
14	Q.	What are the overall rate effects of the changes proposed in this filing?
15	A.	The overall effect of the proposed rates is a rate increase of 1.2 percent, on a net
16		basis, effective October 1, 2019, followed by an incremental increase of 1.6 percent,
17		on a net basis, effective December 1, 2019. The rate change varies by customer type.
18		Exhibit PAC/503 shows the effect of PacifiCorp's proposed prices by delivery service
19		schedule both excluding (base) and including (net) applicable adjustment schedules.
20		Page 1 of the exhibit shows the proposed October 1 rate change. Page 2 of the exhibit
21		shows the proposed incremental December 1 rate change. On both tables, the net
22		rates in Columns 7 and 10 exclude effects of the Low Income Bill Payment
23		Assistance Charge (Schedule 91), the Adjustment Associated with the Pacific

1		Northwest Electric Power Planning and Conservation Act (Schedule 98), the Klamath
2		Dam Removal Surcharges (Schedule 199), the Public Purpose Charge (Schedule
3		290), and the Energy Conservation Charge (Schedule 297).
4	Q.	Did you prepare exhibits showing the impact on customer bills as a result of the
5		proposed rate changes?
6	А.	Yes. Exhibit PAC/504 contains monthly billing comparisons for the October 1 rate
7		change for customers at different usage levels served on each of the major delivery
8		service schedules. Exhibit PAC/505 contains monthly billing comparisons showing
9		the incremental rate impact of the December 1 rate change. Each comparison shows
10		the customer bill before and after the proposed change and shows the change as a
11		percentage. These bill comparisons include the effects of all adjustments schedules
12		including the Low Income Bill Payment Assistance Charge (Schedule 91), the
13		Adjustment Associated with the Pacific Northwest Electric Power Planning and
14		Conservation Act (Schedule 98), the Klamath Dam Removal Surcharges (Schedule
15		199), the Public Purpose Charge (Schedule 290), and the Energy Conservation
16		Charge (Schedule 297).
17	Q.	What is the estimated monthly impact to an average residential customer?
18	A.	The estimated monthly impact to the average residential customer using 900 kilowatt-
19		hours per month is \$1.18 beginning October 1 plus an additional \$1.51 beginning
20		December 1. The total monthly bill increase for this customer from present rates is
21		\$2.69.
22	Q.	Does this conclude your direct testimony?
23	A.	Yes.

BEFORE THE PUBLIC UTILITY COMMISSION OF OREGON

PACIFICORP

Exhibit Accompanying Direct Testimony of Judith M. Ridenour

Proposed Tariff Schedule 202, Renewable Adjustment Clause

SUPPLY SERVICE ADJUSTMENT

Page 1

Purpose

This schedule recovers, between rate cases, the costs to construct or otherwise acquire facilities that generate electricity from renewable energy sources and for associated electricity transmission.

This adjustment is to recover the actual and forecasted revenue requirement associated with the prudently incurred costs of resources, including associated transmission, that are eligible under Senate Bill 838 (2007) and in service as of the date of the proposed rate change. The revenue requirement includes the actual return of and grossed up return on capital costs of the renewable energy source and associated transmission at the currently authorized rate of return, forecasted operation and maintenance costs, forecasted property taxes, forecasted energy tax credits, and other forecasted costs not captured in the Transition Adjustment Mechanism (TAM). The revenue requirement for Oregon will be calculated using the forecasted inter-jurisdictional allocation factors based on the same 12-month period used in the TAM.

Applicable

To all Residential consumers and Nonresidential consumers.

Energy Charge

The adjustment rate is listed below by Delivery Service Schedule.

Schedule	Charge
4	0.126 cents per kWh
5	0.126 cents per kWh
15	0.096 cents per kWh
23, 723	0.121 cents per kWh
28, 728	0.124 cents per kWh
30, 730	0.118 cents per kWh
41, 741	0.122 cents per kWh
47, 747	0.107 cents per kWh
48, 748	0.107 cents per kWh
50	0.079 cents per kWh
51, 751	0.125 cents per kWh
52, 752	0.096 cents per kWh
53, 753	0.041 cents per kWh
54, 754	0.070 cents per kWh

(I)

(D)

(C)

(I)

(continued)

Page 2

Special Conditions

- 1. The Company will file this schedule by April 1 of each year, as necessary, for proposed charges relating to new eligible resources and updating all charges already included on this schedule.
- 2. The Company will make an update filing within eight (8) months of the date of the initial filing, or by December 1, to reflect then-current, prudently-incurred actual resource costs or forecasted costs where appropriate, if the cost elements of an eligible resource cannot be verified as of the date of the final round of testimony in the proceeding initiated April 1. If the updated costs are lower than the projected costs in the record of the proceeding, the update will contain sufficient information to support a reduction in the proposed charges before the January 1 effective date. The Company will be allowed to defer for later commission review and incorporation into rates the cost differences between the projected costs in the record and the updated prudently incurred cost elements if (a) such cost elements are higher than the projected costs in the record or (b) if actual capital costs cannot be verified until after December 1.
- 3. Costs recovered in this schedule will be allocated across customer classes using the applicable forecasted energy on the basis of an equal percent of generation revenue applied on a cents per kilowatt-hour to each applicable rate schedule.
- 4. The dates and provisions listed in the special conditions above may be modified if approved by (N) the Commission.
